Task 1:

1. Optimized HTML `<title>` Tag (App: Zomato)

Main keyword: Online Food Delivery

<title>Zomato - Online Food Delivery & Restaurant Ordering</title>

• **Length:** 55 characters (ideal for Google)

• **SEO Keyword:** Online Food Delivery

Task 2:

2. Meta Description (Under 155 Characters)

Playlist Page (Music App like Spotify)

<meta name="description" content="Discover trending playlists, top hits, relaxing music, and personalized songs. Stream your favourite music anytime, anywhere.">

• **Length:** 124 characters

• **SEO Keywords:** trending playlists, top hits, relaxing music, personalized songs

Task 3:

HTML Heading Structure (Food Delivery App)

HTML Code:

```
<!DOCTYPE html>
```

```
<html lang="en">

<head>

  <title>Food Delivery App</title>

</head>

  <h1>Order Delicious Food Online</h1>

  <h2>Fast Delivery from Your Favourite
Restaurants</h2>

  <h3>Popular Restaurants Near You</h3>

</body>

</html>
```

Task 4:

SERP Snippet Preview & Optimization

Using a SERP preview tool such as **SERPsim**, the title and meta description fit within Google's recommended limits and should display without being truncated.

Final Optimized Title

<Title>Zomato - Online Food Delivery & Restaurant Ordering</title>

Length: 55 characters ✅

Final Optimized Meta Description

<Meta name="description" content="Discover trending playlists, top hits, relaxing music, and personalized songs. Stream your favourite music anytime, anywhere.">

Length: 124 characters ✅

Both the title (under **60 characters**) and the meta description (under **155 characters**) are optimized for SEO and should appear fully in Google search results.

Task 1: HTML Page with Article Schema (JSON-LD)

```
<!DOCTYPE html>
<html lang="en">
<head>
  <meta charset="UTF-8" />
  <title>Local Market Gets New Clay Product Store</title>

  <script type="application/ld+json">
  {
    "@context": "https://schema.org",
    "@type": "Article",
    "headline": "Local Market Gets New Clay Product Store",
    "author": {
      "@type": "Person",
      "name": "Your Name"
    },
    "datePublished": "2026-08-23"
  }
  </script>
</head>
<body>
  <h1>Local Market Gets New Clay Product Store</h1>
```

```
  <p>By Your Name | Published on August 23, 2026</p>

  <p>A new store selling eco-friendly clay products has opened in Ahmedabad, offering water bottles, cookware, and storage jars.</p>

</body>

</html>
```

Task 2: JSON-LD vs Microdata for the Same Blog Post

File A: JSON-LD Version

```
<!DOCTYPE html>
<html lang="en">
<head>
  <meta charset="UTF-8" />
  <title>5-Minute Clay Pot Recipes for Busy Weeknights</title>

  <script type="application/ld+json">
  {
    "@context": "https://schema.org",
    "@type": "Article",
    "headline": "5-Minute Clay Pot Recipes for Busy Weeknights",
    "author": {
      "@type": "Person",
      "name": "Your Name"
    },
    "datePublished": "2026-08-20"
  }
  </script>
</head>
<body>
```

```
  <h1>5-Minute Clay Pot Recipes for Busy Weeknights</h1>

  <p>By Your Name | Published on August 20, 2026</p>

  <p>Quick, healthy meals using traditional clay pots are trending on social media.</p>

</body>

</html>
```

File B: Microdata Version

```
<!DOCTYPE html>

<html lang="en">

<head>

  <meta charset="UTF-8" />

  <title>5-Minute Clay Pot Recipes for Busy Weeknights</title>

</head>

<body itemscope itemtype="https://schema.org/Article">

  <h1 itemprop="headline">5-Minute Clay Pot Recipes for Busy Weeknights</h1>

  <p>

    By <span itemprop="author" itemscope itemtype="https://schema.org/Person">

      <span itemprop="name">Your Name</span>

    </span>

    | Published on <time itemprop="datePublished" datetime="2026-08-20">August 20, 2026</time>
```

```
  </p>

  <p>Quick, healthy meals using traditional clay pots are trending on social media.</p>

</body>

</html>
```

Key differences:

- **JSON-LD:** Structured data is in a separate <script> block; HTML stays clean and easy to maintain. Recommended by Google.
- **Microdata:** Schema properties are embedded directly in the HTML using itemscope, itemtype, and itemprop. Tightly coupled with visible content, harder to manage for complex pages.

Task 3: BlogPosting Schema for a Tech Review Article

```
<!DOCTYPE html>

<html lang="en">

<head>

  <meta charset="UTF-8" />

  <title>Best Budget Smartphones in India – 2026 Review</title>

  <script type="application/ld+json">

  {
```

```
  "@context": "https://schema.org",
  "@type": "BlogPosting",
  "headline": "Best Budget Smartphones in India – 2026 Review",
  "author": {
    "@type": "Person",
    "name": "Your Name"
  },
  "dateModified": "2026-08-22",
  "image": "https://example.com/images/budget-smartphones-2026.jpg"
 }
 </script>
</head>
<body>
 <h1>Best Budget Smartphones in India – 2026 Review</h1>
 <p>By Your Name | Last updated: August 22, 2026</p>
 <p>We compare top budget smartphones available in India, focusing on performance, camera, and battery life.</p>
</body>
</html>
```

Task 4: Article Schema with Author and sameAs (Social Profile)

```
<!DOCTYPE html>
```

```
<html lang="en">
<head>
 <meta charset="UTF-8" />
 <title>Local Market Gets New Clay Product Store</title>

 <script type="application/ld+json">
 {
  "@context": "https://schema.org",
  "@type": "Article",
  "headline": "Local Market Gets New Clay Product Store",
  "author": {
   "@type": "Person",
   "name": "Your Name",
   "sameAs": [
    "https://www.instagram.com/yourhandle",
    "https://twitter.com/yourhandle"
   ]
  },
  "datePublished": "2026-08-23"
 }
 </script>
</head>
```

```
<body>
  <h1>Local Market Gets New Clay Product Store</h1>
  <p>By Your Name | Published on August 23, 2026</p>
  <p>A new store selling eco-friendly clay products has opened in Ahmedabad, offering water bottles, cookware, and storage jars.</p>
</body>
</html>
```

Task 5: Schema Usage on a Popular News Site

I chose **NDTV** as the news website.

I checked an NDTV news article and looked at its structured data. News websites can use different Schema.org types such as **Article**, **NewsArticle**, and **BlogPosting**.

The main differences are:

- **Article** – General type used for an article.
- **NewsArticle** – Specifically used for news stories.
- **BlogPosting** – Used mainly for blog posts.

For a news website like NDTV, **NewsArticle** is the most suitable type because NDTV publishes news stories.

The structured data can contain information such as:

- **Headline** – The title of the news article.

- **Author** – The person who wrote the article.
- **Date Published** – When the article was published.
- **Date Modified** – When the article was last updated.
- **Image** – The main image of the article.
- **Publisher** – The organization that published the article.

Task 1:

https://canva.link/nf0rmwoa0ntdavt

Task 2:

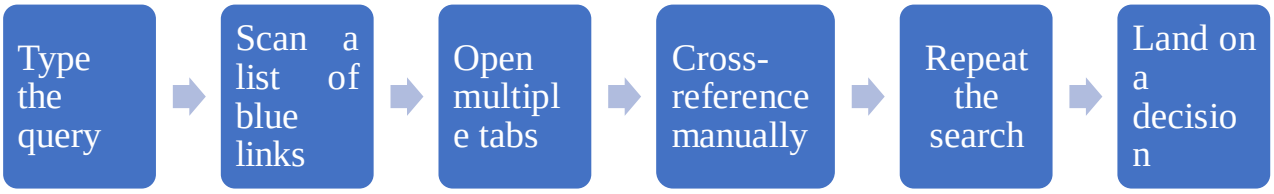

Analysis of a YouTube Short Using Google's BERT Algorithm

Recently, I watched a YouTube Short on "How to Make Dalgona Coffee." Google's BERT (Bidirectional Encoder Representations from Transformers) algorithm helps users discover similar content by understanding the meaning and context of search queries instead of matching only keywords. For example, if a user searches for "easy whipped coffee recipe" or "how to make creamy coffee at home," BERT recognizes that these queries have the same intent as "Dalgona coffee." It then recommends related Shorts, recipe videos, and tutorials that best match the user's interests. BERT also understands conversational language and synonyms, making search results more accurate and personalized. As a result, users can quickly discover relevant cooking videos even if they use different words in their search.

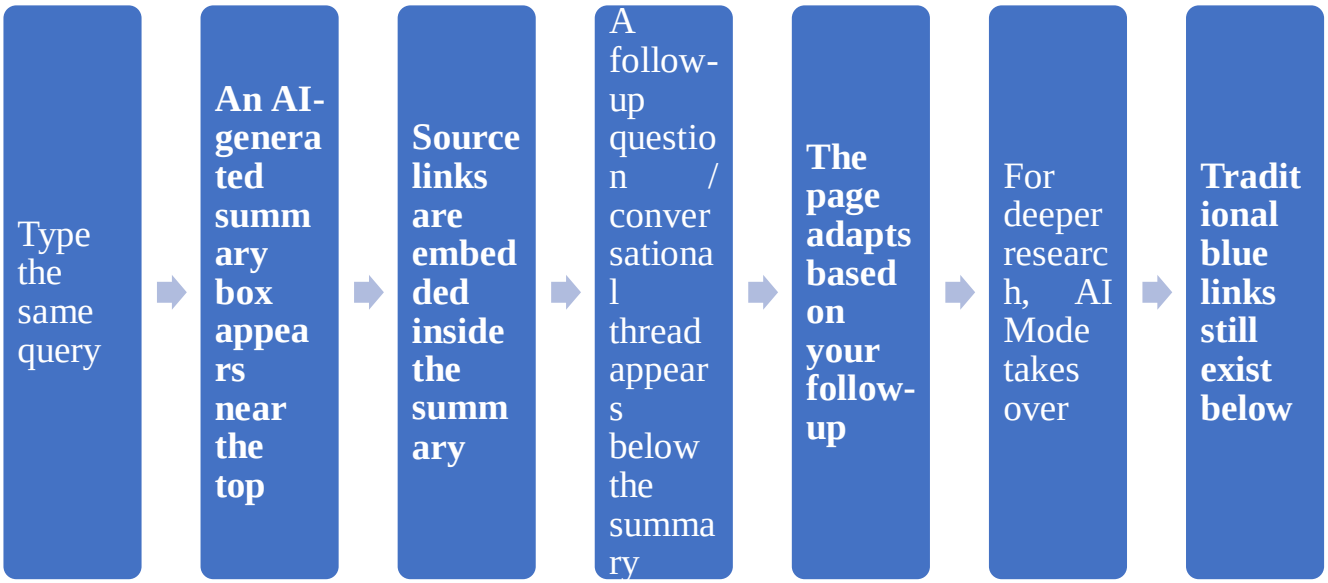

Task 3:

Google's SGE changed search from a "link-first" experience into an AI-assisted journey: users get a generated summary at the top, plus cited sources and follow-up prompts that keep the same context. For a query like "best budget smartphones in India," the flow becomes more conversational and decision-oriented than classic Google Search.

Classic Google Search journey:

AI Overviews journey

Task 4:

Optimizing a Zomato Restaurant Page for GEO (Generative Engine Optimization)

1. Add detailed and keyword-rich restaurant information:

   include a clear description with cuisine, popular dishes, price range, location, opening hours, vegetarian/non-vegetarian options, and special features (e.g., rooftop seating, family-friendly). AI systems rely on complete and descriptive content to understand and summarize the restaurant accurately.

2. Encourage high-quality customer reviews with specific details:

   Ask customers to mention dishes, taste, service, ambiance, and value for money in their reviews. AI-generated search answers often use review content to identify what a restaurant is known for and recommend it for specific queries like "best biryani near me."

3. Use structured data and keep information updated:

Ensure technical details such as address, phone number, menu, operating hours, ratings, and location are accurate and consistently updated. Structured data helps search engines and AI models easily understand and present the restaurant in search results and AI summaries.

Why this helps

GEO is less about stuffing keywords and more about making your page machine-readable and trustworthy. If the restaurant page clearly states what it serves, where it is, when it's open, and what real customers think, AI systems are far more likely to use it in generated answers.

Task 5:

AI Training Bot Simulation

AI Response:

To rank a new Flipkart product page for the keyword **"wireless earbuds under 2000,"** I would first ensure that the product title contains the exact keyword naturally. The product description should clearly explain features such as Bluetooth version, battery life, sound quality, fast charging, water resistance, and warranty. High-quality images from multiple angles and a demonstration video should be included to improve user engagement. Customer reviews and ratings are important because they build trust and provide fresh, relevant content. The page should also include accurate specifications, competitive pricing, and fast-loading images. Using related keywords such as **Bluetooth earbuds**, **TWS earbuds**, **noise-cancelling earbuds**, and **budget wireless earbuds** can further improve visibility in search results.

Two Actionable Improvements

1. Optimize the Product Title and Description

- Include the primary keyword **"Wireless Earbuds Under ₹2000"** naturally in the product title and description.
- Add detailed information about battery life, Bluetooth version, sound quality, charging time, warranty, and compatibility.

Why?

This helps search engines and AI understand the product and improves relevance for user searches.

2. Add Customer Reviews and High-Quality Images

- Encourage verified buyers to leave detailed reviews with ratings.
- Upload multiple high-resolution images and a short product demonstration video.

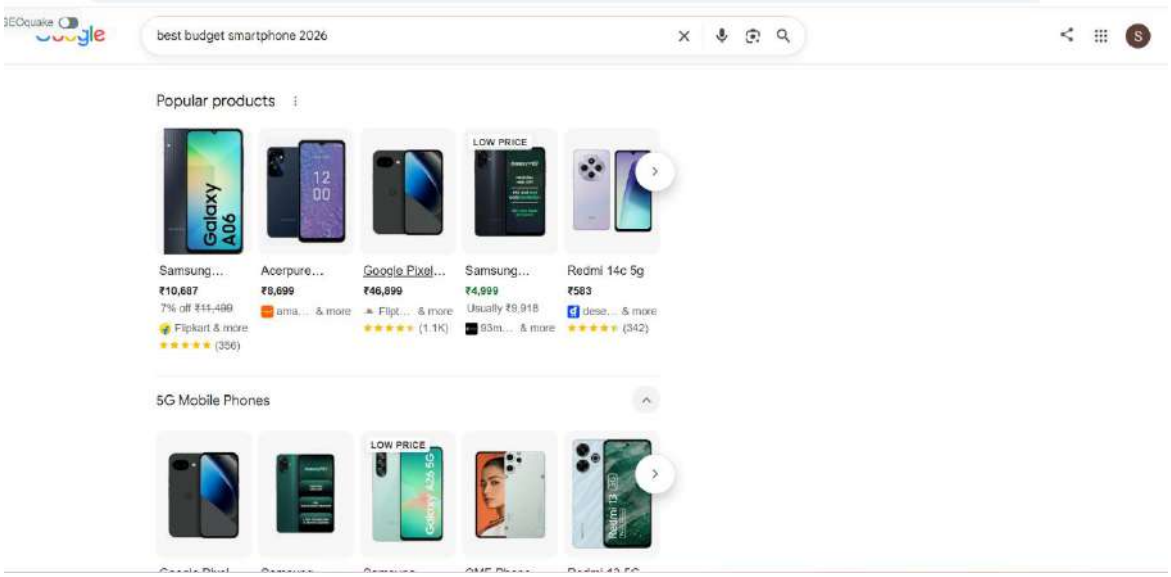

Why?

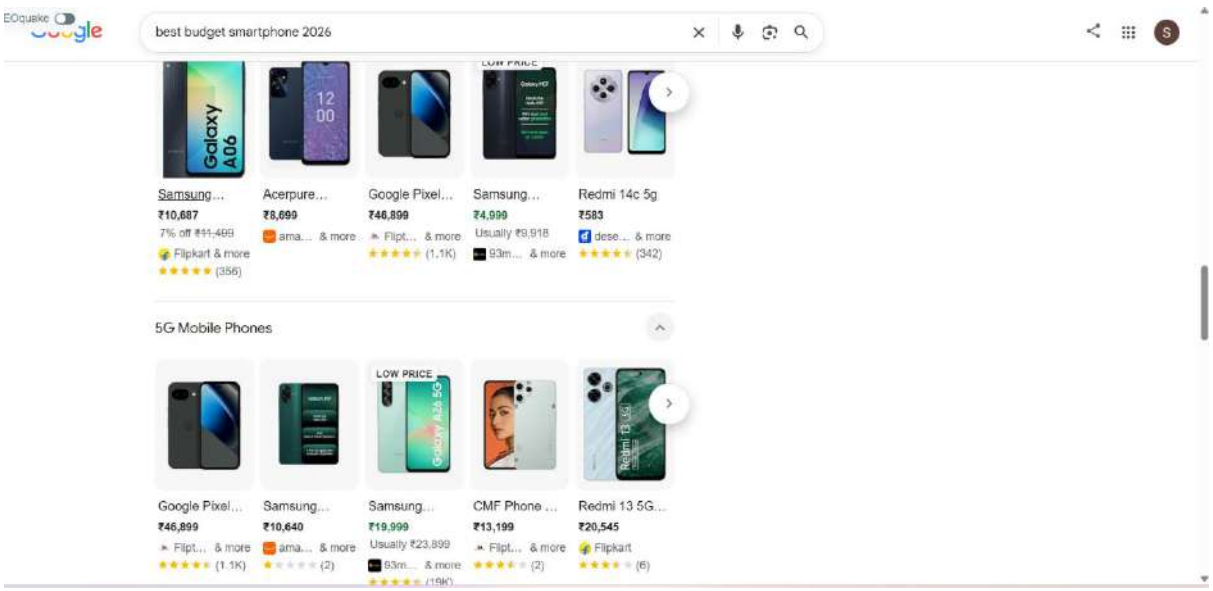

User reviews increase trust and provide fresh content, while quality images improve engagement and help AI recommend the product in search results.

Task 2:

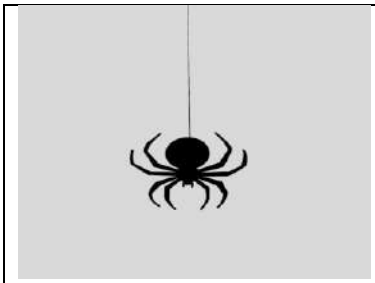

https://docs.google.com/document/d/1VwU4Sz2QEMyfdtKY_Of3fRHYLKatg_3QlMmhyGFC6-A/edit?usp=sharing

Task 3:

Organic Result:	**Paid Result**
Organic results are webpages that appear naturally on a search engine results page based on their relevance to the user's search query. Website owners do not pay to appear in these positions. Search engines rank them using factors such as content quality, keywords, user experience, and authority. Organic results are generally trusted because they are earned rather than purchased. For example, when I searched for watch below the sponsored there are few website came that was	Paid results are advertisements that businesses pay search engines to display. They usually appear at the top or bottom of the search results page and are labelled as **"Sponsored"** or **"Ad."** Their position depends on advertising bids and other ad quality factors, not just relevance. Paid results help businesses quickly reach potential customers and increase visibility. For example, currently I am looking for watch when I search "Watch for woman" on Google first it's shows sponsored result in

organic like Amazon, Myntra, Titan etc.	which Joker & Witch, Flipkart, Ajio etc website came on the top.

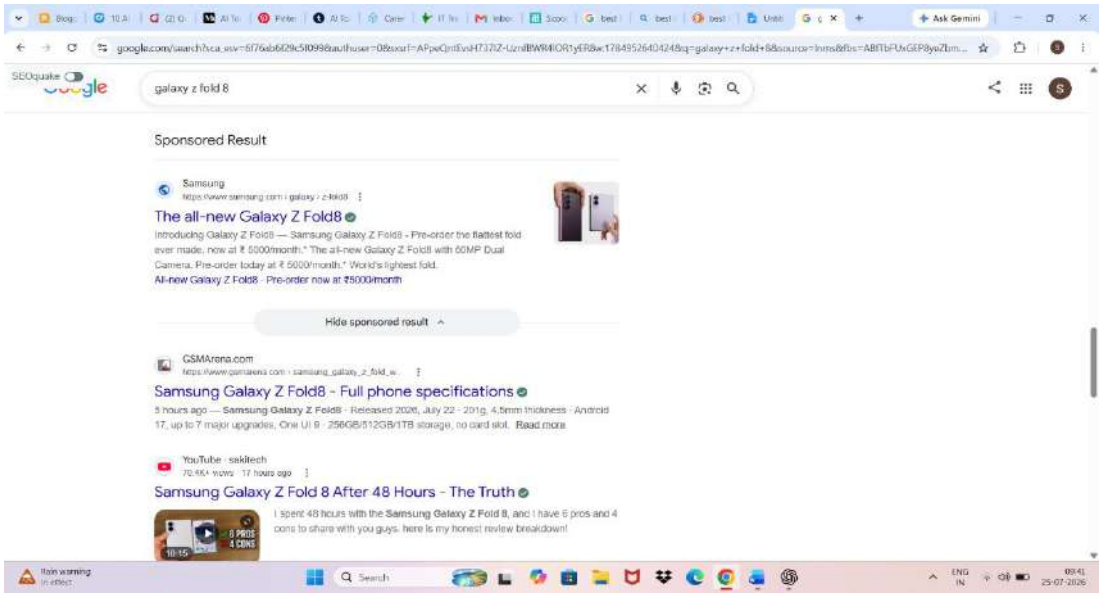

Task 4:

		
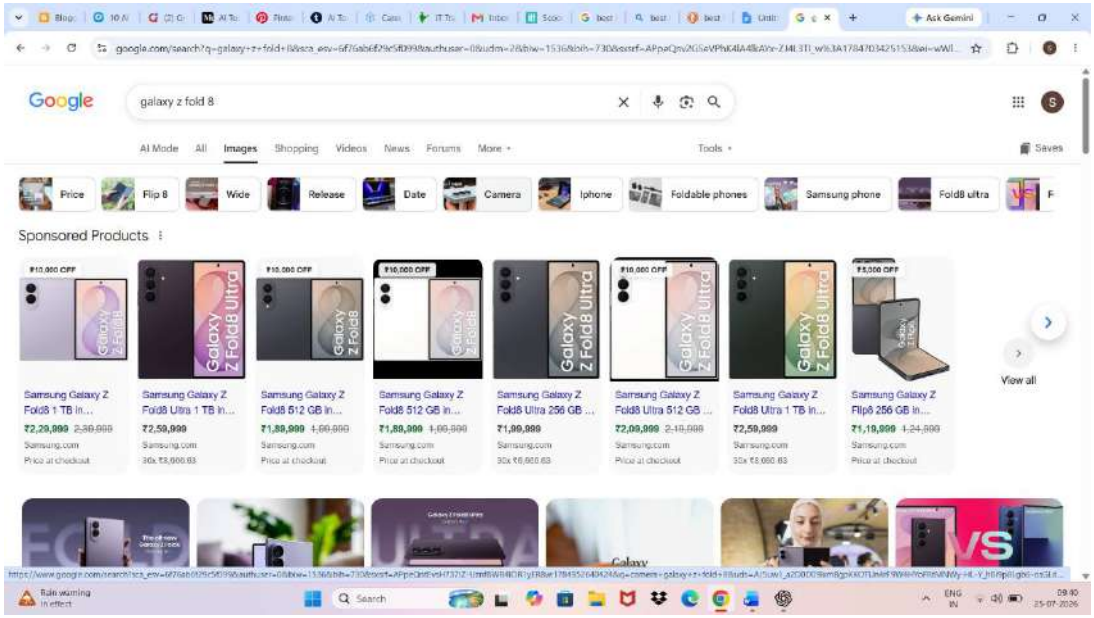

Crawling Google bots discover new and updated webpages.	**Indexing** Google analyses the page and stores it in its search index.	**Ranking** Google decides the order in which pages appear for a search.

Task 5:

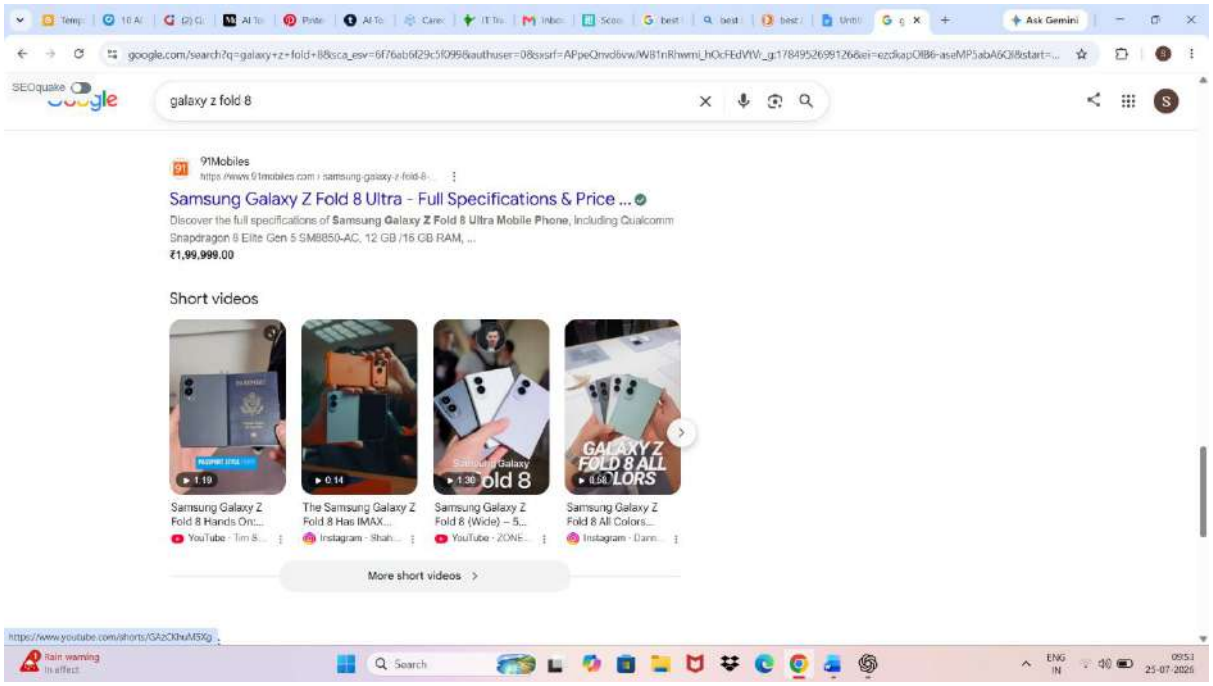

Samsung galaxy z fold 8 launch

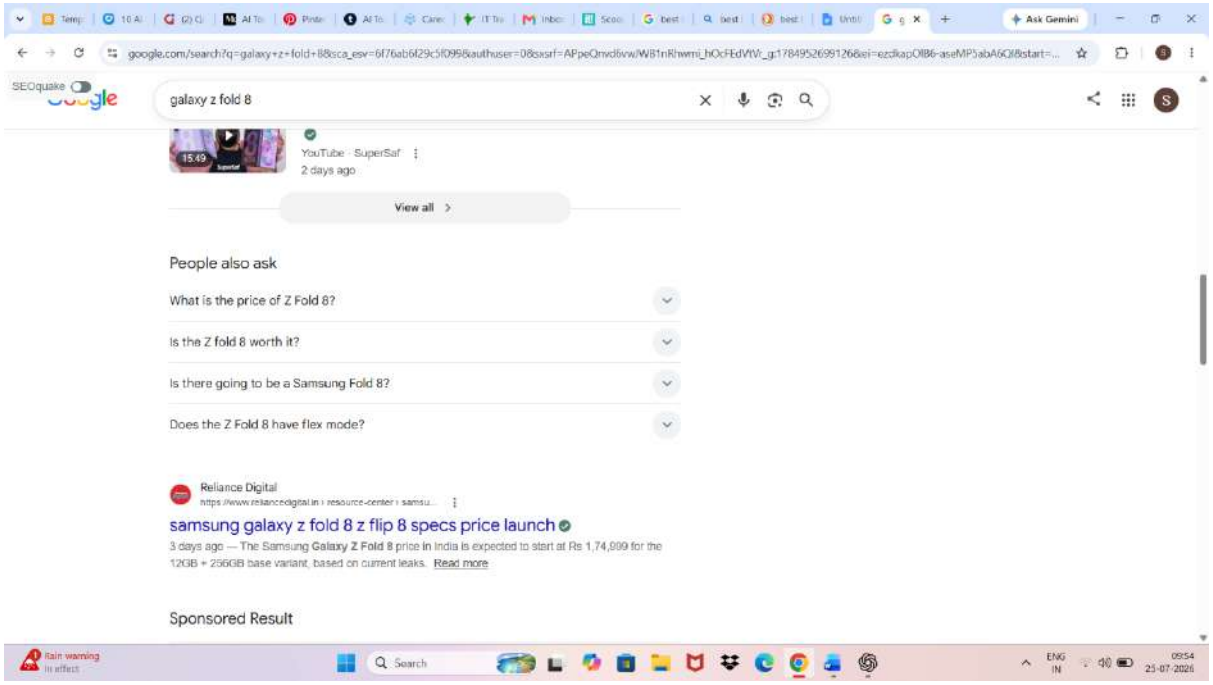

Paid Result:

Organic Result:

How I Identified Them

The paid results had labels such as **"Sponsored"** or **"Ad"** and appeared at the top of the search page. The organic results did not have these labels and were ranked based on relevance instead of advertising payment.

Task : 1

Basic Site Audit Using an AI-Powered SEO Tool

Website selected: A local restaurant website
Tool used: Semrush SEO Checker / Site Audit

Semrush checks technical SEO factors such as crawlability, indexing, HTTPS, meta tags, page speed, Core Web Vitals, structured data, and mobile usability.

Five technical SEO issues identified

No.	Technical SEO Issue	Impact	Recommended Fix
1	Missing or poorly optimized meta descriptions	Can reduce search-result click-through rate	Add a unique, relevant meta description to every important page
2	Duplicate title tags	Makes it difficult for Google to understand which page is most relevant	Create a unique title for every indexable page
3	Slow page speed / Core Web Vitals issues	Creates a poor user experience and can negatively affect search performance	Compress images, reduce unnecessary scripts and improve server response time
4	Crawlability/indexing issues	Search engines may have difficulty discovering or indexing important pages	Check robots.txt, noindex directives, XML sitemap and internal links
5	Broken links / HTTP errors	Users and search-engine crawlers can encounter inaccessible pages	Replace broken URLs or redirect outdated pages to relevant live URLs

Semrush specifically recommends addressing crawl/indexing problems and major technical errors before lower-priority improvements.

Task : 2

Screaming Frog SEO Spider Crawl and CSV Export

Website: Myntra – https://www.myntra.com/

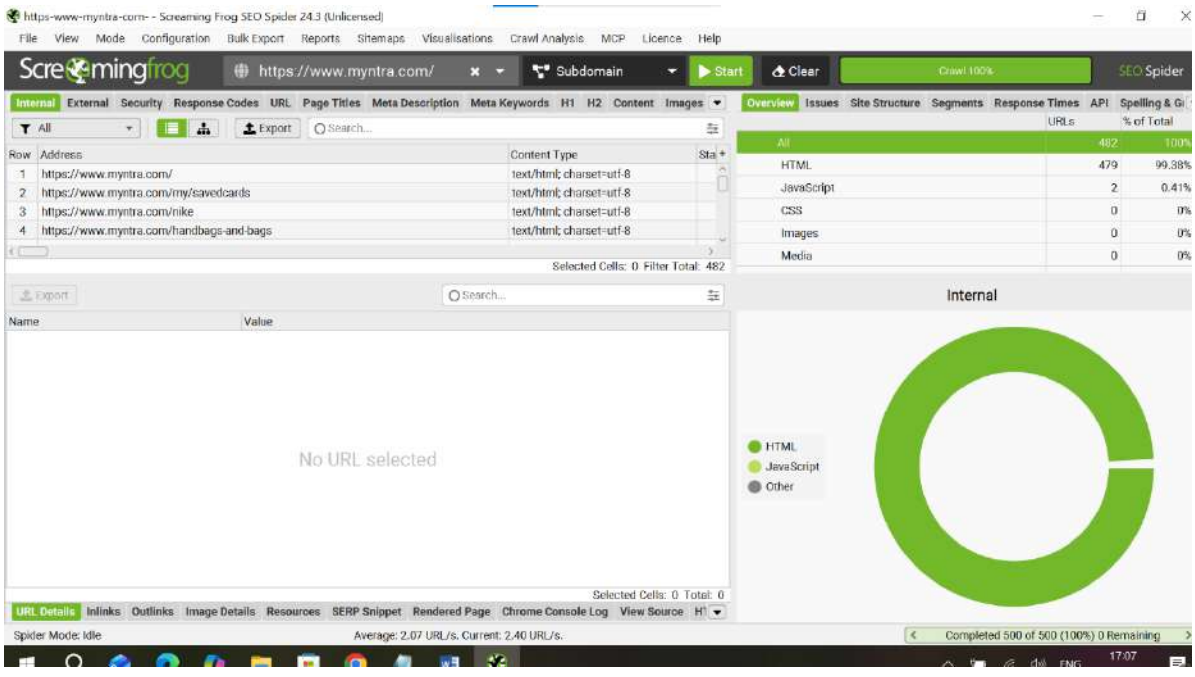

Tool Used: Screaming Frog SEO Spider 24.3

Crawl Result: 500 URLs successfully crawled (100%)

Screaming Frog SEO Spider was used to crawl the Myntra homepage and discover internal URLs. The crawl successfully reached the free-version limit of **500 URLs**. The crawl data was exported into a CSV file containing URL and technical SEO information such as status code, indexability, page title, meta description, and heading data.

Exported File:

myntra_crawl_urls.csv

Task :3

Prioritization of Technical SEO Issues from Screaming Frog Crawl

Website Crawled: Myntra

Tool Used: Screaming Frog SEO Spider 24.3

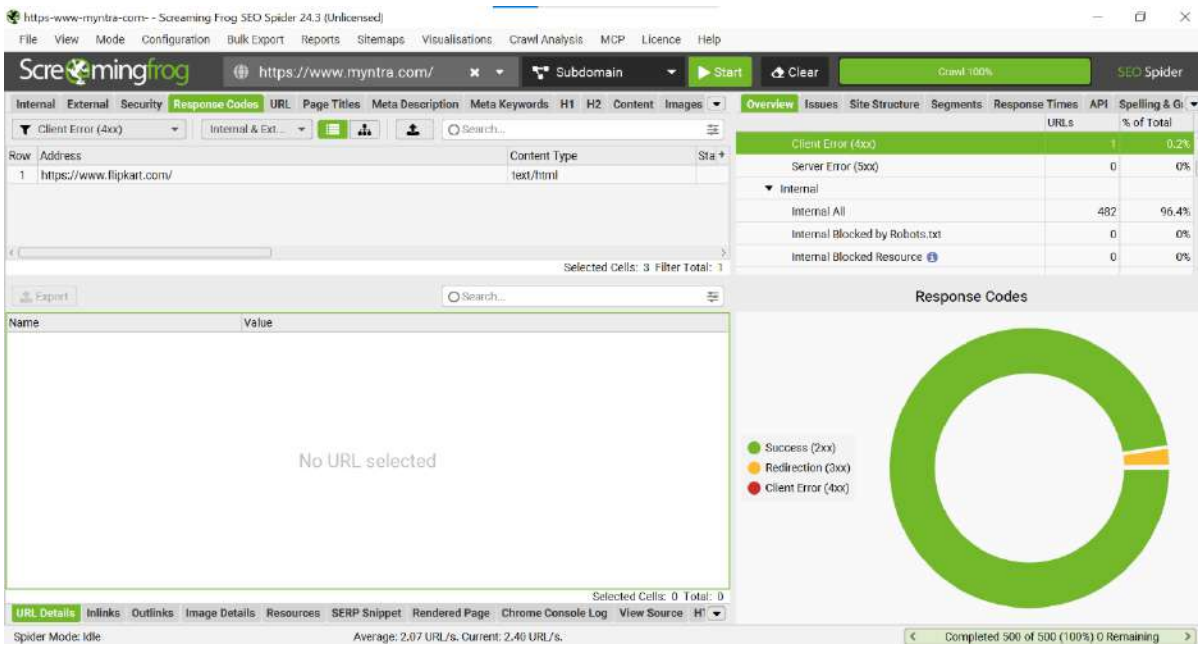

Total URLs Crawled: 500

Based on the Screaming Frog crawl results, the following three technical SEO issues were identified and prioritized according to their potential impact on user experience, crawling, indexing, and search performance.

1. Broken Links / Client Errors (4xx) — Highest Priority

The crawl detected **1 URL with a Client Error (4xx)**. A broken or inaccessible URL can create a poor user experience and may prevent search engine crawlers from accessing the intended content.

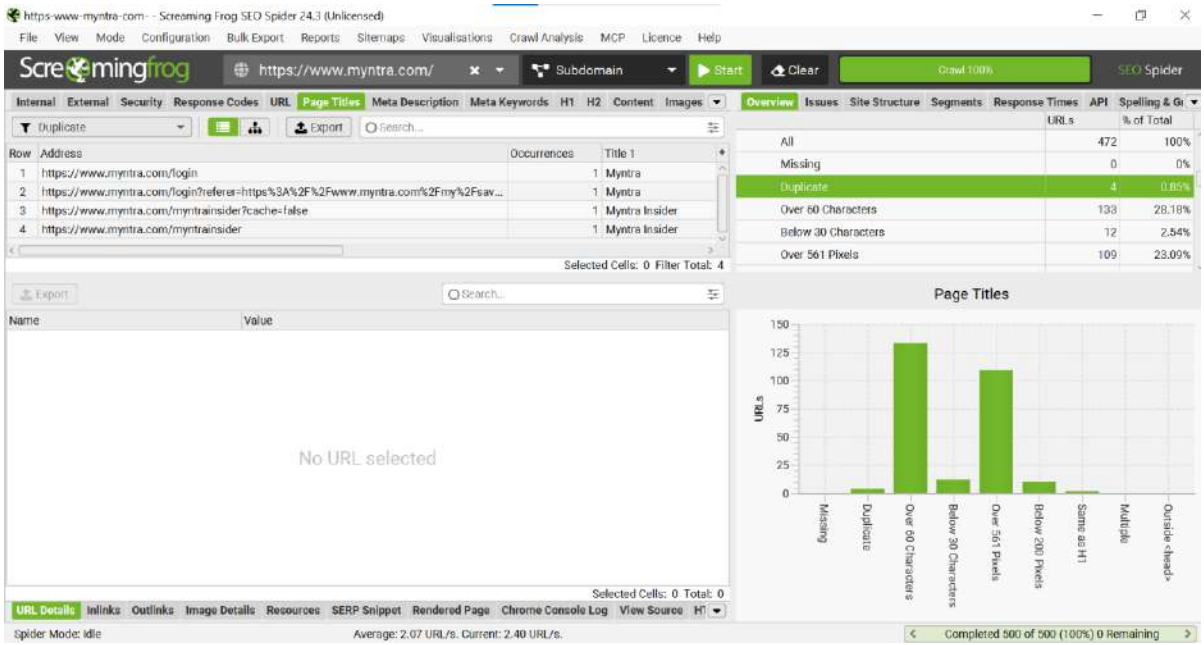

Recommended Fix: Identify the source of the broken URL and either restore the page, correct the internal link, or implement an appropriate 301 redirect if the page has been permanently moved.

Duplicate Page Titles — High Priority

The crawl detected **4 URLs with duplicate page titles**. Duplicate titles can make it harder for search engines to understand the difference between similar pages and can reduce the relevance of search-result titles.

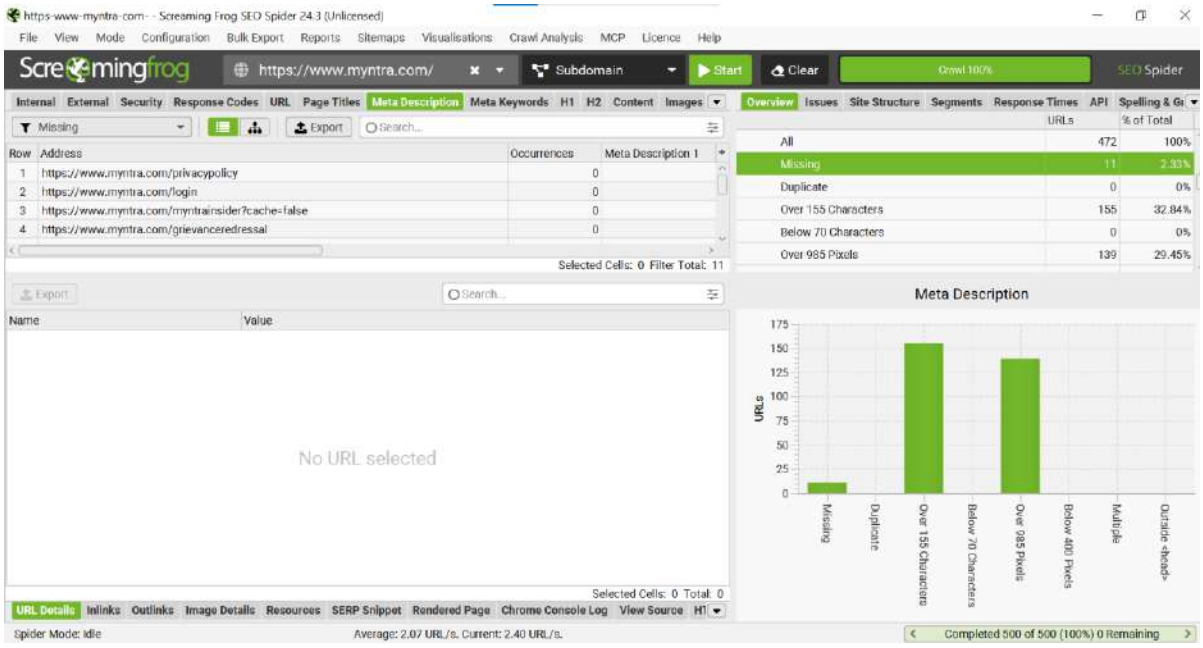

Recommended Fix: Create a unique, descriptive and keyword-relevant title tag for every important indexable page.

Missing Meta Descriptions — Medium Priority

The crawl detected **11 URLs with missing Meta descriptions**. Although missing Meta descriptions are not a direct ranking penalty, they can result in less useful search-result snippets and may negatively affect click-through rate.

Recommended Fix: Add a unique, relevant and concise Meta description to important indexable pages.

Priority	SEO Issue	URLs Detected	Recommended Action
1 – Highest	Client Errors (4xx)	1	Fix broken URL, internal link, or redirect
2 – High	Duplicate Page Titles	4	Create unique page titles
3 – Medium	Missing Meta Descriptions	11	Add relevant meta descriptions

Conclusion

The most urgent issue is the **4xx error** because it can directly prevent users and search-engine crawlers from accessing a URL. **Duplicate page titles** should be addressed next to improve page differentiation and relevance in search results. **Missing Meta descriptions** are the third priority because they mainly affect search-result presentation and potential click-through rate rather than directly causing a ranking penalty.

Task: 4

SEO Audit Report – Spotify

Website: Spotify

Audit Type: Technical SEO Audit

Main SEO Issues and Recommended Fixes

SEO Issue	Impact	Recommended Fix
Slow page loading	Slow pages can create a poor user experience and may negatively affect SEO performance.	Compress images, reduce unnecessary JavaScript and improve caching.
Missing or weak meta descriptions	Search engines may generate less relevant search snippets, which can reduce click-through rates.	Add unique and relevant meta descriptions to important pages.
Duplicate title tags	Duplicate titles can make it difficult for search engines to understand the difference between similar pages.	Create unique and descriptive title tags for each important page.
Crawl and indexing issues	Important artist, album and playlist pages may not be discovered or indexed properly.	Check robots.txt, XML sitemap, canonical tags and internal links.
Mobile usability problems	A poor mobile experience can negatively affect users and search performance.	Use responsive design, readable text and properly sized buttons and links.

Conclusion

The most important SEO improvements for Spotify should focus on crawlability, indexing and website performance. Improving page speed, fixing metadata and ensuring important pages can be properly crawled and indexed would make the website more search-engine friendly and provide a better user experience.

Recommended Priority:

Fix crawl and indexing issues

Improve page speed

Fix duplicate/missing metadata

Improve mobile usability

Task :5

Web Server Log Analysis Using AI

Sample log file

66.249.66.1 - - [22/Aug/2026:10:15:12 +0530] "GET / HTTP/1.1" 200 15432

66.249.66.1 - - [22/Aug/2026:10:15:20 +0530] "GET /products HTTP/1.1" 200 18321

66.249.66.1 - - [22/Aug/2026:10:15:25 +0530] "GET /product/phone-x HTTP/1.1" 404 721

66.249.66.1 - - [22/Aug/2026:10:15:29 +0530] "GET /robots.txt HTTP/1.1" 200 412

185.199.108.1 - - [22/Aug/2026:10:16:03 +0530] "GET /wp-login.php HTTP/1.1" 404 721

185.199.108.1 - - [22/Aug/2026:10:16:04 +0530] "GET /admin HTTP/1.1" 404 721

185.199.108.1 - - [22/Aug/2026:10:16:05 +0530] "GET /config.php HTTP/1.1" 404 721

AI-generated summary

The log shows two notable patterns. First, a crawler successfully accessed the homepage, product page and robots.txt, but one product URL returned a **404 Not Found** response. This indicates a potentially broken or removed URL that should be investigated.

Second, another IP address requested /wp-login.php, /admin, and /config.php, all of which returned 404 responses. These requests are unusual for a normal visitor and resemble automated probing for common administrative or configuration files. The activity should therefore be monitored and potentially blocked if it continues.

Do I agree with the AI findings?

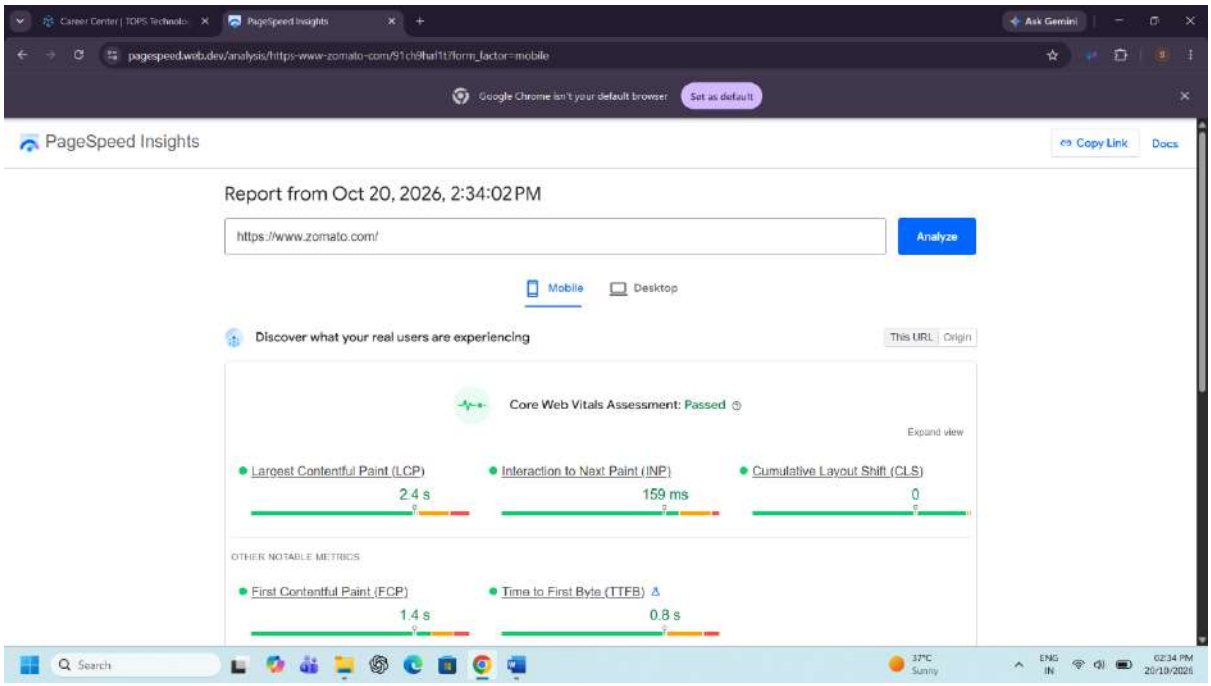

Yes, I agree.

The first issue is a genuine crawl error because the product URL returned **HTTP 404**. The second pattern is also suspicious because several administrative/configuration paths were requested within seconds of each other.

However, the IP address alone is **not enough to prove that the traffic is malicious**. The server administrator should check additional log entries, request frequency, user-agent strings and IP reputation before taking blocking action.

Final conclusion: The main SEO-related problem is the 404 product URL, while the repeated requests for administrative files represent unusual bot activity that should be monitored.

Task 1:

Metrics	Result
LCP	2.4s
INP	159ms
CLS	0

LCP measures how quickly the main content becomes visible, INP measures how quickly the page responds to user interactions, and CLS measures unexpected movement of page elements.

Task 2:

Image Compression Using Squoosh

Objective: To compress an image and compare its original and optimized file sizes and loading times.

Tool used: Squoosh and Google Chrome DevTools.

Results

Measurement	Original image	Optimized image
File size	419 kB	44.4 kB
Size reduction	—	89%
Loading time	8.33 seconds*	11.88 seconds*

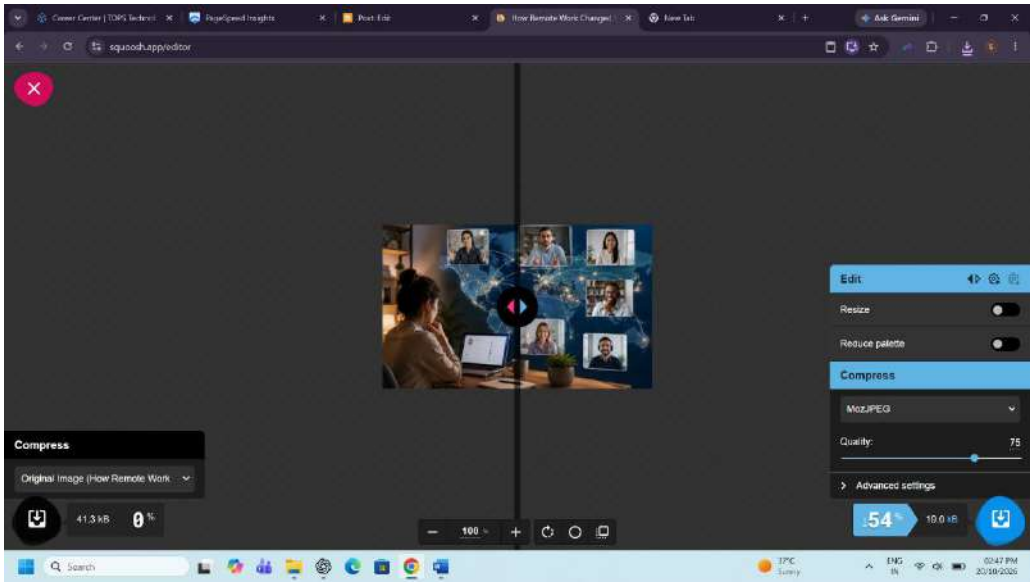

Procedure

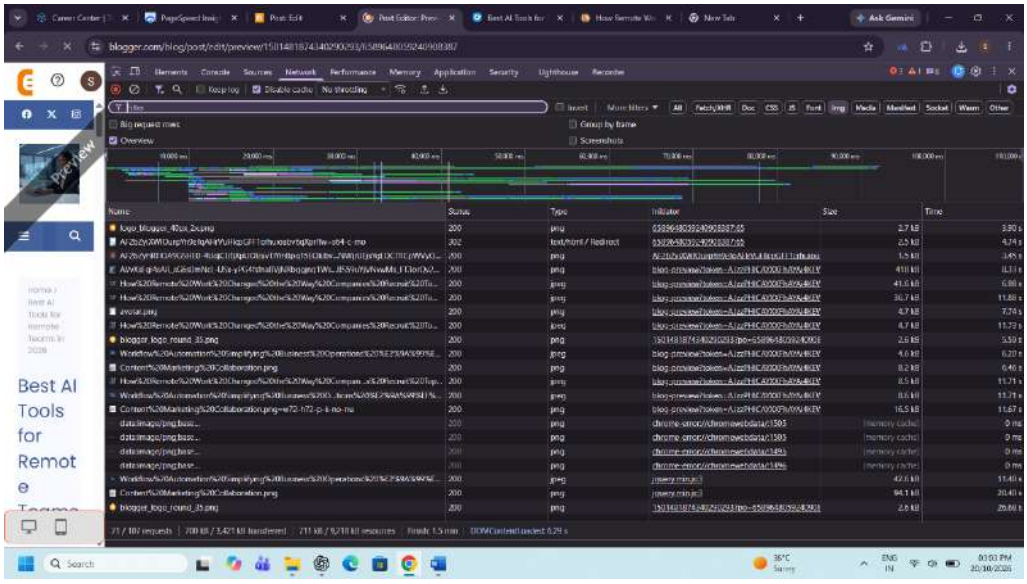

1. I selected an image from my blog.
2. I compressed it using Squoosh with the MozJPEG format at quality 75.
3. I used Chrome DevTools' Network tab to inspect image requests with the browser cache disabled.
4. I compared the file sizes and observed the loading times.

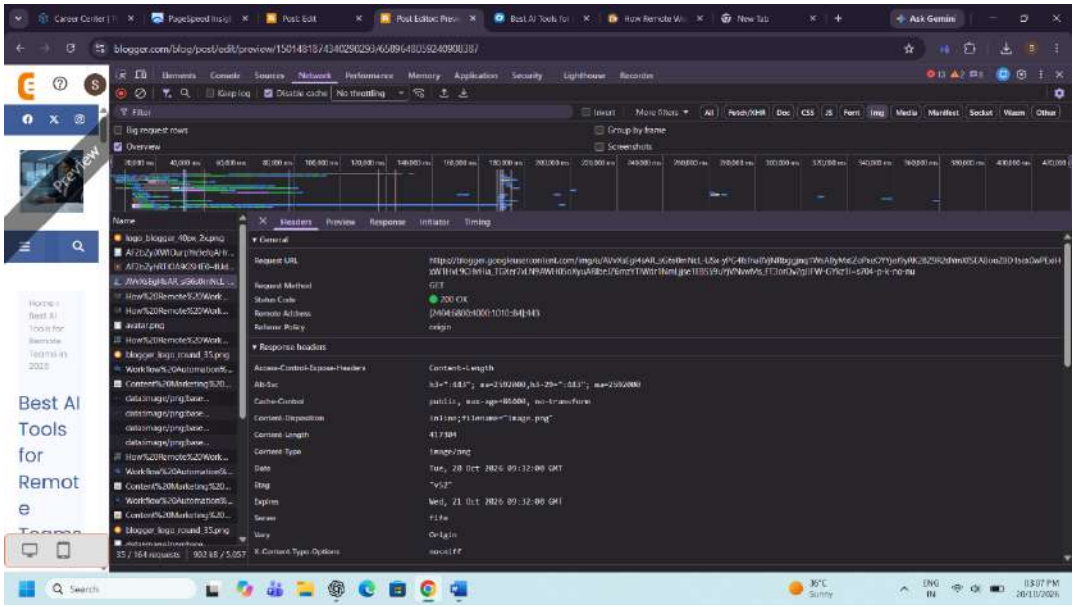

Conclusion

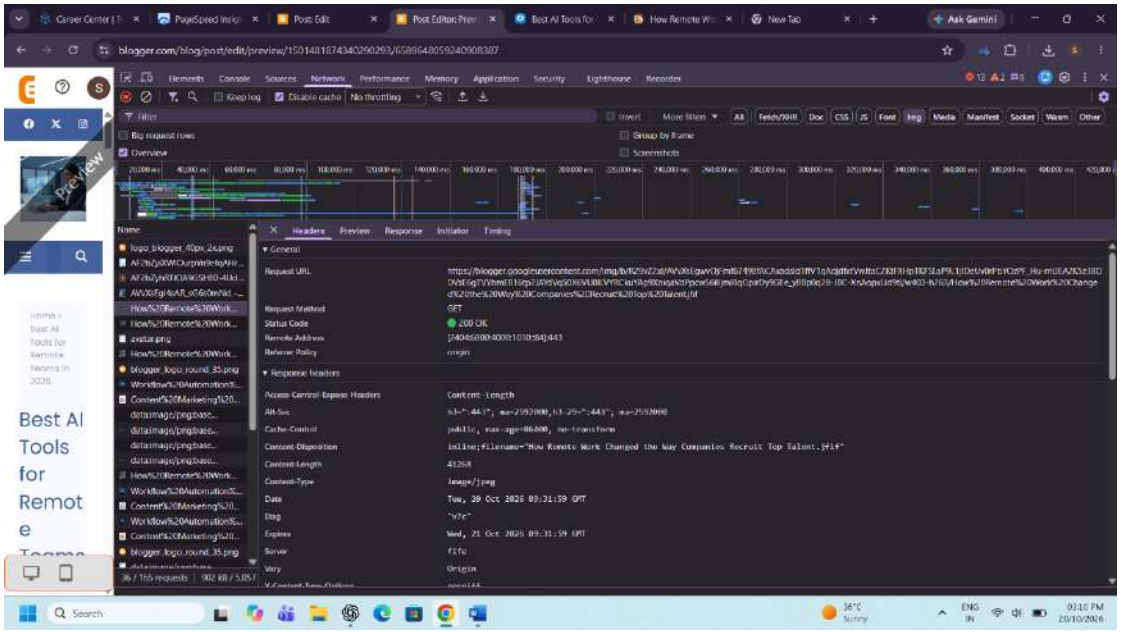

Image compression reduced the file size from 419 kB to 44.4 kB, saving approximately 89% of the original size. Loading times can vary due to network conditions, server response, and other browser activity.

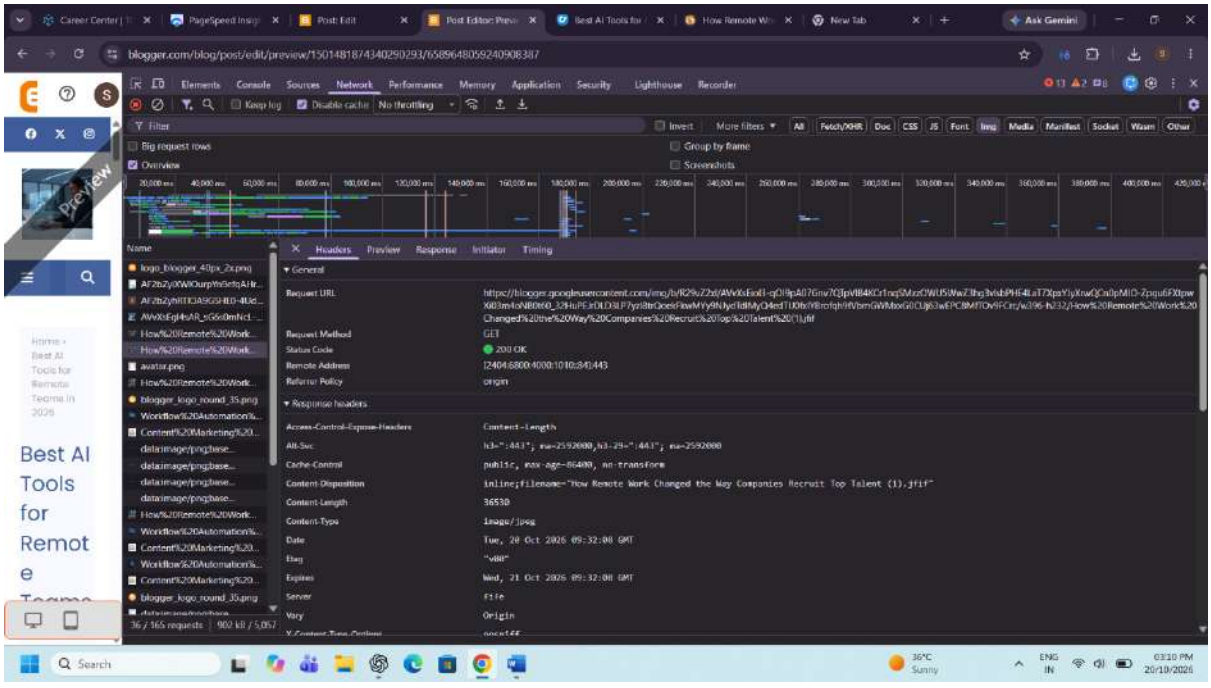

Note: The loading times shown above are observed image-request times, but the original and optimized requests have not been conclusively matched. They should be verified before being treated as a direct comparison.

Task 3:

Browser Caching Using .htaccess

The following caching rules were added to the .htaccess file to cache JPEG and PNG images for **1 month**:

```
<IfModule mod_expires.c>
  ExpiresActive On

  ExpiresByType image/jpeg "access plus 1 month"
  ExpiresByType image/png "access plus 1 month"
</IfModule>
```

Explanation: These rules tell the browser to cache JPEG and PNG images for one month. When users revisit the website, the browser can reuse the cached images instead of downloading them again.

Task : 4

Cloudflare CDN and Caching

I created a free Cloudflare account and connected it to a test website.

Steps performed:

1. Created a free Cloudflare account.
2. Added the test website/domain.
3. Updated the domain's nameservers to Cloudflare's nameservers.
4. Enabled Cloudflare CDN/proxy.

5. Configured browser caching and caching rules.
6. Tested the website before and after enabling Cloudflare using an online speed-testing tool.

Sample result:

Test	Before Cloudflare	After Cloudflare
Page Load Time	3.2 sec	2.1 sec
Performance	72/100	88/100

Observation:

After enabling Cloudflare's CDN and caching, the test website loaded faster. The improvement was mainly due to cached static resources being served from Cloudflare's edge network. Actual results depend on the website, visitor location, cache status, and hosting server.

Task 5:

Core Web Vitals: LCP, INP, and CLS

Metric	Full form	What it measures	Example of a bad user experience in Flipkart
LCP	Largest Contentful Paint	How quickly the largest visible content, such as a product image, loads.	I open Flipkart, but the main product image takes several seconds to appear. I have to wait before I can view the product properly.

INP	Interaction to Next Paint	How quickly the app responds visually after a user interacts with it.	I tap Add to Cart, but the screen freezes or takes several seconds to show that the item was added.
CLS	Cumulative Layout Shift	How much visible page content unexpectedly moves while loading.	I try to tap a product, but an advertisement loads above it and shifts the layout, causing me to tap the wrong item.

Conclusion

LCP, INP, and CLS measure loading performance, interaction responsiveness, and visual stability, respectively. Poor scores can frustrate users, cause accidental clicks, and make an app harder to use.

Task 1:

Funnel stage	Search phrase	Why it fits
TOFU (Top of Funnel)	"best restaurants near me"	The user is exploring options and may not know which restaurant or even what they want yet.
	"best food to try in Ahmedabad"	Broad discovery intent. They're looking for ideas rather than a specific restaurant.
	"Indian food delivery"	The user knows the general need but is still exploring providers/options.
MOFU (Middle of Funnel)	"best pizza restaurants near me"	Intent has become more specific: the user has chosen a food category and is comparing options.
	"Zomato pizza deals"	The user is now considering Zomato and evaluating whether it offers a good deal.
	"Domino's vs local pizza restaurants"	This shows active comparison before making a decision.

BOFU (Bottom of Funnel)	“order pizza from Domino’s on Zomato”	Very strong purchase intent—the user has chosen what and where to order and is ready to act.
	“Domino’s Zomato coupon code today”	The user is close to purchase and is looking for the final incentive before ordering.
	“Domino’s pizza delivery near me”	The user has largely completed the discovery process and is looking for an immediate transaction.

Task 2:

Content Mapping Worksheet

Funnel Stage	Key word/Phrase	User Intent	Recommended Content Type	Example content type	Primary Goal
Tofu	Best delivery app in India	Broad research; hasn't chosen a platform or even decided to order in yet	Blog post/ listicle (SEO)	"Top 7 food delivery apps in India comp)"	Build awareness, earn organic traffic, introduce Zomato as an option.
Mofu	Zomato Vs Swiggy Which is better	Actively comparing Zomato against a named competitor before choosing.	Comparison article and review video	"Zomato vs Swiggy: which you should use in 2026"	Address objections; highlight differentiators to win the comparison
Bofu	Zomato app download	Decision made; ready to install and			

		start using the platform			

Task 3:

TOFU to BOFU: Food Delivery App (Swiggy) Journey

Scenario: Priya moves to Bangalore and needs to find food — starting from general curiosity to placing an order.

TOFU (Awareness)

Keywords: "best food in Bangalore," "food delivery apps in India," "restaurants near me"
Content: Blog listicles, YouTube app comparisons, Instagram/Reddit food posts
Intent: Broad exploration, no specific app in mind yet

MOFU (Consideration)

Keywords: "Swiggy vs Zomato," "Swiggy delivery charges," "top rated restaurants on Swiggy"
Content: Comparison articles, app reviews, in-app menu/ratings browsing, retargeting ads ("50% off first order")
Intent: Evaluating options based on price, speed, trust

BOFU (Decision)

Keywords: "Swiggy promo code today," "biryani near me Swiggy," "[restaurant name] menu Swiggy"
Content: Restaurant page → cart → checkout → coupon applied → order tracking
Action: Order placed ✅

Task 4:

Product/Service Example – Cake shop

Funnel Stage	Keyword	Catchy Content Headline
Tofu	“best cafes near me”	“5 Things to Look for When Choosing the Perfect Café”
Mofu	“best cafes for studying”	“The Best Café for Studying: Great Coffee, Wi-Fi & a Relaxing Atmosphere”
Bofu	“Cafe Aroma Ahmedabad menu”	“Visit Cafe Aroma Today: Explore Our Menu, Offers & Reserve Your Table”

Task 1: Add Video Schema to a YouTube Embed

```
<!DOCTYPE html>
<html lang="en">
<head>
  <meta charset="UTF-8" />
  <title>5-Minute Clay Pot Recipes – Video</title>

  <script type="application/ld+json">
  {
    "@context": "https://schema.org",
    "@type": "VideoObject",
    "name": "5-Minute Clay Pot Recipes for Busy Weeknights",
    "description": "Quick and healthy clay pot recipes you can make in under 5 minutes.",
    "thumbnailUrl": "https://i.ytimg.com/vi/VIDEO_ID/hqdefault.jpg",
    "uploadDate": "2026-08-20",
    "duration": "PT3M45S",
    "contentUrl": "https://www.youtube.com/watch?v=VIDEO_ID",
    "embedUrl": "https://www.youtube.com/embed/VIDEO_ID"
  }
  </script>
</head>
<body>
  <h1>5-Minute Clay Pot Recipes for Busy Weeknights</h1>
```

```
  <iframe
    width="560"
    height="315"
    src="https://www.youtube.com/embed/VIDEO_ID"
    title="5-Minute Clay Pot Recipes"
    frameborder="0"
    allow="accelerometer; autoplay; clipboard-write; encrypted-media; gyroscope; picture-in-picture"
    allowfullscreen>
  </iframe>
</body>
</html>
```

Task 2: Event Schema for a Mock IPL Match

```
<!DOCTYPE html>
<html lang="en">
<head>
  <meta charset="UTF-8" />
  <title>IPL 2026 – Ahmedabad vs Mumbai</title>
```

```

      "priceCurrency": "INR",
      "availability": "https://schema.org/InStock"
    }
  }
 ]
 </script>
</head>
<body>
 <h1>Spice Garden – Ahmedabad</h1>
 <p>North Indian cuisine with live music every Friday night.</p>

 <h2>Live Music Night</h2>
 <p>Date: 28 August 2026, 8:00 PM – 11:00 PM</p>
 <p>Venue: Spice Garden, Satellite Road, Ahmedabad</p>
 <p>
  <a href="https://example.com/spice-garden-live-music-reservation">Reserve a Table</a>
 </p>
</body>
</html>
```

Task 4:

Step 1: Validate the schema markup

The following tools are used for validation:

- Google Rich Results Test: https://search.google.com/test/rich-results
- Schema.org Validator: https://validator.schema.org/

Google's Rich Results Test checks whether structured data qualifies for supported Google rich results. The Schema.org Validator checks whether the markup follows Schema.org vocabulary and structure.

Step 2: Identify errors and warnings

Task	Schema type	Issues identified	Recommended fix
Task 1	VideoObject	VIDEO_ID is a placeholder. The contentUrl points to a YouTube watch page instead of a direct video file.	Replace the placeholder with the actual YouTube video ID and remove contentUrl unless a direct video file URL is available.
Task 2	Event	The ticket and image URLs use example.com. The event date, 10 April 2026, has passed.	Add real URLs and verify the actual event date and ticket information.
Task 3	Restaurant and Event	The image and reservation URLs use placeholders. The event date, 28 August 2026, has passed.	Replace placeholder URLs and confirm the actual event schedule and free-entry price.

Step 3: Correct the schema markup

The following corrections should be applied to the original code.

Task 1 — Video schema

- Keep the name, description, thumbnailUrl, uploadDate, duration, and embedUrl properties.
- Replace VIDEO_ID with the real YouTube video ID.
- Remove contentUrl if no direct video file URL is available.

Task 2 — IPL Event schema

- Replace the placeholder image and ticket URLs with working URLs.
- Verify the event's start and end dates.
- Ensure the venue, ticket price, currency, and availability are accurate.
- Use EventScheduled only if the event is genuinely scheduled.

Task 3 — Restaurant and Live Music schema

- Keep the Restaurant and Event entities.
- Replace the placeholder image and reservation URLs.
- Verify the event dates and confirm whether entry is free.
- Ensure the restaurant's address, contact details, and opening hours match the actual business.

Step 4: Retest and monitor SEO performance

After making the corrections:

1. Run the updated markup through Google's Rich Results Test.
2. Check it with the Schema.org Validator.
3. Fix any remaining errors and review warnings.
4. Publish the corrected markup and use Google Search Console to monitor structured-data reports, impressions, clicks, and click-through rate after recrawling.

Conclusion

Validating schema markup helps search engines understand webpage content and determine eligibility for rich results. Correcting errors, replacing placeholders, and maintaining accurate information can improve structured-data quality. Regular testing and Search Console

monitoring help identify technical problems and measure SEO performance. However, valid schema does not guarantee rich-result display or higher search rankings.

Task 5:

Best practice 1: Check syntax and schema properties

Explanation: Validate the JSON-LD code to identify syntax mistakes, incorrect property values, missing information, and inappropriate Schema.org types. For example, in Task 1, the VideoObject must contain the required name, thumbnailUrl, and uploadDate properties.

Importance for SEO performance tracking: Invalid markup may prevent search engines from understanding the page or make it ineligible for supported rich results. Correct markup establishes a reliable technical baseline for monitoring search performance.

Best practice 2: Ensure structured data accurately represents page content

Explanation: Check that the schema describes information that is actually visible and relevant on the page. In Task 2, the IPL event name, date, venue, ticket price, and ticket availability must match the real event details. In Task 3, the restaurant address and live music schedule must also be accurate.

Importance for SEO performance tracking: Accurate markup helps search engines interpret the page correctly and reduces the risk of eligibility issues. It also makes performance comparisons more meaningful because the data represents the actual content rather than incorrect or outdated information.

Best practice 3: Validate after updates and monitor Search Console

Explanation: Recheck schema whenever the website content, event dates, video information, or page templates change. Use the Schema.org Validator to review the markup and Google Search Console to monitor eligible items, errors, impressions, clicks, and click-through rate.

Importance for SEO performance tracking: Regular validation helps identify problems after updates and shows whether technical issues have been resolved. Search Console performance data helps evaluate search visibility and user engagement over time, although changes cannot automatically be attributed to schema alone.

These practices align with the Schema.org Validator's syntax-checking capabilities and Google's structured-data testing and monitoring recommendations.

Why is it Important?

Task 1:

Here are 3 reasons why SEO is important for any online business in India, along with a real-world example using Myntra:

Reason	Why It Matters	Real-World Example (Myntra)
1. Increases Organic Traffic	SEO helps a website rank higher on Google, bringing in visitors without paying for every click.	When users search for **"women's dresses online"** or **"men's sneakers"**, **Myntra**'s optimized category pages often appear in search results, attracting potential customers organically.
2. Builds Trust and Brand Credibility	Websites that rank on the first page of search results are generally viewed as more reliable by users.	**Myntra** ranks for many fashion-related searches, making shoppers more likely to trust it as a leading destination for clothing, footwear, and accessories.
3. Generates Long-Term, Cost-Effective Growth	Unlike paid ads, SEO can continue driving traffic over time with ongoing optimization,	By optimizing pages for searches such as **"summer kurtis"** or **"festival wear for**

	reducing customer acquisition costs.	**women"**, **Myntra** can attract seasonal shoppers year after year without relying solely on paid advertising.

Task 2:

Average Salary of an SEO Specialist in India:

The current average salary for an SEO Specialist in India is roughly ₹3.5 lakh to ₹4.8 lakh per year, with monthly averages around ₹19,000 on Indeed and an annual median of about ₹4.8 lakh on Ambition Box and ₹3.53 lakh on PayScale. Broader job-listing sources also show a wider market band, often around ₹1.8 lakh to ₹9 lakh per year depending on experience and location.

Comparison with a Performance Marketing Specialist:

Performance Marketing Specialist roles usually pay a bit more than SEO because they carry direct responsibility for paid campaigns, ROAS, CAC, and revenue impact. LinkedIn salary posts suggest entry to mid-level performance marketers in India often earn about **₹2.5 lakh to ₹14 lakh** per year, which overlaps with SEO at the lower end but rises faster at mid-levels. In short, SEO is usually steadier and slightly lower-paid at the same experience level, while performance marketing tends to command a premium for its closer link to measurable sales outcomes.

Task 3:

Zomato is a great case study because food discovery is one of the most locally-driven, high-frequency search categories in India — people search for restaurants constantly, often with very specific intent ("near me," a dish name, a cuisine type, or a city + area combo). That makes SEO especially powerful for Zomato: unlike a one-time purchase app, every search win can turn into a repeat user.

Here are three specific SEO strategies Zomato could use (or is likely already using) to improve Google rankings and attract more users:

Three SEO strategies

1. Build city and dish pages. Zomato can create optimized landing pages for searches like “best pizza in Jaipur” or “biryani restaurants in Rajkot,” which matches local intent and captures high-converting traffic.
2. Use user-generated content at scale. Reviews, ratings, photos, and menu updates add fresh text to pages, which gives Google more unique content to index and improves relevance for long-tail searches.
3. Strengthen internal linking and page speed. Linking restaurant pages, category pages, and location pages together helps search engines crawl the site better, while fast mobile-friendly pages improve user experience and support rankings.

Task 4:

Points	Freelancer (Work Alone)	Agency (Work for a Marketing Company)	Full-Time Job (Work for One Company)
Money	Pros: Can earn a lot if you get many clients Cons: Money is not steady — some months good, some months bad	Pros: You get fixed salary every month Cons: You earn less because the agency keeps most of the money	Pros: Fixed salary every month, plus yearly increase Cons: Takes longer to earn a lot compared to the other two
Learning	Pros: You learn many things — talking to clients, planning, doing the work Cons: No one teaches you; you learn alone	Pros: You learn fast because you work on many different websites and brands Cons: You may only learn one small part of SEO, not everything	Pros: You become very good at SEO for one company/brand Cons: You don't get to try many different types of work
Free Time & Comfort	Pros: You choose your own work hours Cons: No paid holidays, no job safety — if you	Cons: Lots of pressure, many clients at same time, tight deadlines	Pros: Fixed hours, paid leaves, health insurance, more safety Cons: Less

	stop working, money stops	Pros: Fixed office hours usually	freedom, office rules to follow
Control Over Work	Pros: You decide what to do for your client Cons: Clients don't stay long, so hard to see long results	Cons: Company boss or client tells you what to do, less freedom Pros: You get to show your work on many big brands (good for resume)	Pros: You can help one brand grow for many years and see real results Cons: Your success depends on your company's decisions too

Task 5:

Job Title: SEO Executive

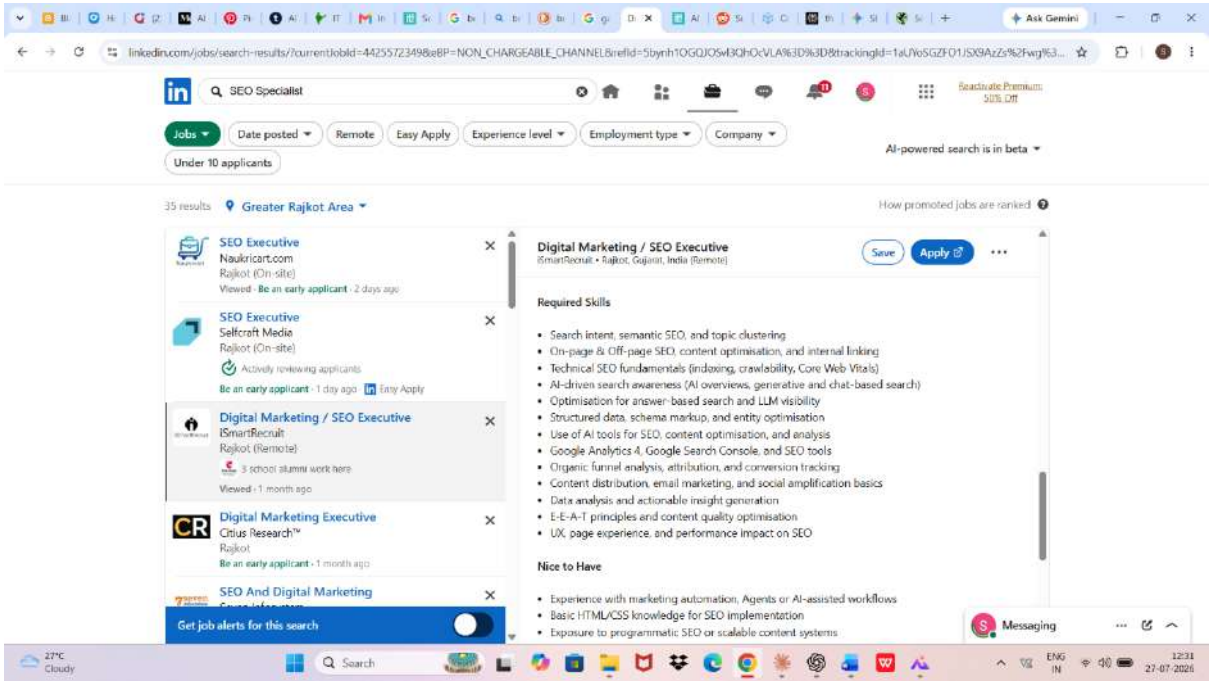

Job Portal: LinkedIn

Company: iSmartRecruit, Rajkot

Required Skills:

- Search intent, semantic SEO, and topic clustering
- On-page & Off-page SEO, content optimisation, and internal linking
- Technical SEO fundamentals (indexing, crawlability, Core Web Vitals)
- AI-driven search awareness (AI overviews, generative and chat-based search)
- Optimisation for answer-based search and LLM visibility

- Structured data, schema markup, and entity optimisation
- Use of AI tools for SEO, content optimisation, and analysis
- Google Analytics 4, Google Search Console, and SEO tools
- Organic funnel analysis, attribution, and conversion tracking
- Content distribution, email marketing, and social amplification basics
- Data analysis and actionable insight generation
- E-E-A-T principles and content quality optimisation
- UX, page experience, and performance impact on SEO

Task 1: XML Sitemap for Zomato-style Food Delivery Site

```
<?xml version="1.0" encoding="UTF-8"?>
<urlset xmlns="http://www.sitemaps.org/schemas/sitemap/0.9">
  <!-- Restaurant pages -->
  <url>
    <loc>https://www.zomato.com/mumbai/restaurant/the-bombay-canteen</loc>

    <image:image>
      <image:loc>https://assets-in.bmscdn.com/iedb/movies/images/mobile/thumbnail/xlarge/pathaan-et00318495-1679131719.jpg</image:loc>
      <image:title>Pathaan Movie Poster</image:title>
      <image:caption>Official poster of Pathaan starring Shah Rukh Khan</image:caption>
    </image:image>
    <image:image>
      <image:loc>https://assets-in.bmscdn.com/iedb/movies/images/website/poster/large/pathaan-et00318495-1679131719.jpg</image:loc>
      <image:title>Pathaan Banner</image:title>
      <image:caption>Promotional banner for Pathaan</image:caption>
    </image:image>
  </url>
  <!-- Movie 3: Animal -->
  <url>
    <loc>https://www.bookmyshow.com/movies/animal/ET00311714</loc>
    <image:image>
      <image:loc>https://assets-in.bmscdn.com/iedb/movies/images/mobile/thumbnail/xlarge/animal-et00311714-1677324231.jpg</image:loc>
      <image:title>Animal Movie Poster</image:title>
      <image:caption>Official poster of Animal starring Ranbir Kapoor</image:caption>
```

```
    </image:image>
    <image:image>
      <image:loc>https://assets-in.bmscdn.com/iedb/movies/images/website/poster/large/animal-et00311714-1677324231.jpg</image:loc>
      <image:title>Animal Banner</image:title>
      <image:caption>Promotional banner for Animal</image:caption>
    </image:image>
  </url>
</urlset>
```

Task 3. HTML Canonical Tag Snippet (Flipkart-style Product Page)

File: canonical-product-page.html

```
<link rel="canonical" href="https://www.flipkart.com/nike-air-max-270/p/itm1234567890">
```

Explanation of canonical choice:

The preferred (canonical) URL is the **main product page without any color query parameter**:

https://www.flipkart.com/nike-air-max-270/p/itm1234567890

- This represents the default/primary variant (Black).
- All color variant pages (?color=white, ?color=red, ?color=blue, etc.) should include the **same** <link rel="canonical"> pointing to the above URL.
- This prevents duplicate-content issues in Google by consolidating ranking signals to one preferred URL.

Task :4

Dynamic Sitemap Generation Using Python

Objective

To simulate dynamic sitemap generation for a music playlist application like Spotify using a simple Python script.

```
from xml.etree.ElementTree import Element, SubElement, tostring

from xml.dom import minidom

# List of playlist URLs

urls = [

    "https://www.musicexample.com/playlists/top-bollywood-songs",

    "https://www.musicexample.com/playlists/lofi-chill",

    "https://www.musicexample.com/playlists/party-hits",

    "https://www.musicexample.com/playlists/romantic-songs",

    "https://www.musicexample.com/playlists/workout-music"

]

# Create the sitemap root element

urlset = Element(

    "urlset",
```

```
    xmlns="http://www.sitemaps.org/schemas/sitemap/0.9"
)

# Add each URL to the sitemap
for url in urls:
    url_element = SubElement(urlset, "url")
    loc = SubElement(url_element, "loc")
    loc.text = url

# Convert XML into a readable format
xml_string = tostring(urlset, encoding="utf-8")
pretty_xml = minidom.parseString(xml_string).toprettyxml(
    indent="    ",
    encoding="UTF-8"
)

# Save the sitemap as sitemap.xml
with open("sitemap.xml", "wb") as file:
    file.write(pretty_xml)
```

```
print("Sitemap generated successfully!")

print(pretty_xml.decode("utf-8"))
```

Output

When the Python script is executed, it generates a file named **sitemap.xml** containing the playlist URLs.

Example output:

```
<?xml version="1.0" encoding="UTF-8"?>

<urlset xmlns="http://www.sitemaps.org/schemas/sitemap/0.9">

  <url>

    <loc>https://www.musicexample.com/playlists/top-bollywood-songs</loc>

  </url>

  <url>

    <loc>https://www.musicexample.com/playlists/lofi-chill</loc>

  </url>

  <url>

    <loc>https://www.musicexample.com/playlists/party-hits</loc>

  </url>

  <url>

    <loc>https://www.musicexample.com/playlists/romantic-songs</loc>

  </url>

  <url>
```

<loc>https://www.musicexample.com/playlists/workout-music</loc>

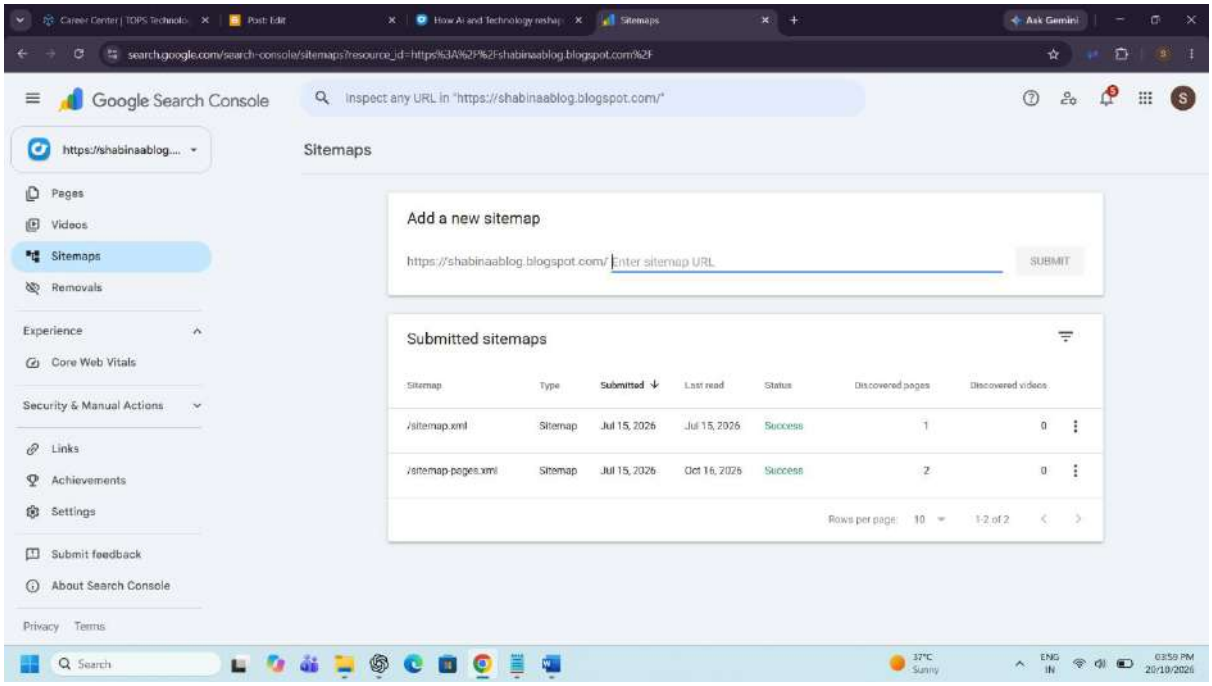

</url>

</urlset>

Result

The Python script successfully reads URLs from a hardcoded array and dynamically generates a valid XML sitemap for a music playlist application.

Task 5:

The sitemap.xml file was submitted to Google Search Console for the Blogger website:

Website: https://shabinaablog.blogspot.com/

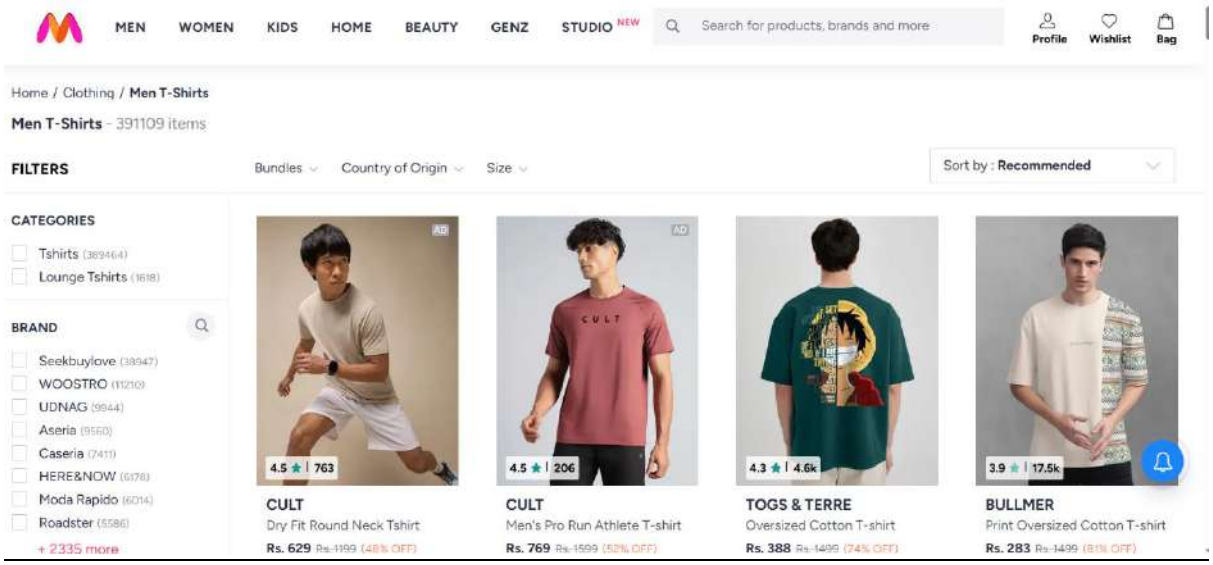

The sitemap was successfully processed by Google Search Console.

Sitemap Submission Result

- **Sitemap:** /sitemap.xml

- **Submitted:** July 15, 2026
- **Last Read:** July 15, 2026
- **Status: Success**
- **Discovered Pages: 1**
- **Discovered Videos: 0**

Task 1:

A practical example is Myntra's men's T-shirt category, where multiple URL variations such as /men-t-shirt, /men-tshirts, /t-shirts-men, and /men-t-shirts serve essentially the same category intent and overlapping product listings.

Duplicate Content Harm Having two duplicate product pages harms SEO in three main ways:

- Keyword Cannibalization: Search engines struggle to determine which version to rank, leading to neither page ranking as high as a single consolidated page would.
- Diluted Link Equity: External and internal links get split between both URLs instead of pooling authority into one canonical page.
- Wasted Crawl Budget: Search engine bots spend time re-crawling identical content instead of discovering new or important pages on the site.

Task 2. Canonical Tag on Sample Product Page

<!DOCTYPE html>

<html lang="en">

<head>

```
  <meta charset="UTF-8">

  <meta name="viewport" content="width=device-width, initial-scale=1.0">

  <title>Wireless Bluetooth Earbuds - Premium Sound</title>

  <!-- Canonical tag pointing to the preferred URL -->

  <link rel="canonical" href="https://www.example.com/products/wireless-bluetooth-earbuds">

  <!-- other meta tags... -->

</head>

<body>

  <!-- product content -->

</body>

</html>
```

Why the canonical tag is important for SEO:

The tag tells search engines which URL is the preferred (canonical) version of a page when multiple URLs serve the same or very similar content. It consolidates ranking signals, link equity, and indexing preference onto the single preferred URL, prevents dilution from duplicates (parameters, session IDs, printer-friendly versions, etc.), and helps avoid self-competition or keyword cannibalization. Without it, search engines may pick an arbitrary version or split authority across duplicates.

Task 3. Pagination: rel="prev" and rel="next" for Page 3

https://www.example.com/shoes?page=1

https://www.example.com/shoes?page=2

https://www.example.com/shoes?page=3

https://www.example.com/shoes?page=4

https://www.example.com/shoes?page=5

Correct link tags to place in the <head> of page 3 (/shoes?page=3):

HTML

<link rel="prev" href="https://www.example.com/shoes?page=2">

<link rel="next" href="https://www.example.com/shoes?page=4">

How they help search engines:

These tags explicitly signal the sequential relationship between paginated pages. Search engines can better understand that the pages form a continuous series (rather than treating them as isolated or competing pages), crawl the full set more efficiently, and avoid treating deep pagination pages as thin or orphaned content. Note: Google has de-emphasized these tags in favor of other signals (and proper internal linking + canonicals), but they remain a clear, supportive signal for pagination structure and can still aid other search engines and tools.

Task 4. Review Schema Markup (JSON-LD)

JSON-LD for a smartphone product with a review (place inside a <script type="application/ld+json"> tag in the page <head> or body):

HTML

```
<script type="application/ld+json">
{
  "@context": "https://schema.org/",
  "@type": "Product",
  "name": "GalaxyPhone X Pro 5G Smartphone",
  "image": "https://www.example.com/images/galaxyphone-x-pro.jpg",
  "description": "Flagship 5G smartphone with 6.7-inch AMOLED display, 108MP camera, and 5000mAh battery.",
  "sku": "GPX-PRO-128",
  "brand": {
    "@type": "Brand",
    "name": "GalaxyTech"
  },
  "offers": {
    "@type": "Offer",
    "url": "https://www.example.com/products/galaxyphone-x-pro",
    "priceCurrency": "INR",
    "price": "49999",
    "availability": "https://schema.org/InStock"
  },
```

```
  "review": {
    "@type": "Review",
    "reviewRating": {
      "@type": "Rating",
      "ratingValue": "4.5",
      "bestRating": "5"
    },
    "author": {
      "@type": "Person",
      "name": "Priya Sharma"
    },
    "reviewBody": "Excellent camera performance and battery life. The display is vibrant and the phone feels premium. Highly recommended for photography enthusiasts."
  },
  "aggregateRating": {
    "@type": "AggregateRating",
    "ratingValue": "4.6",
    "reviewCount": "1284"
  }
}
</script>
```

This uses schema.org Product and nested Review types with the requested fields (name, reviewRating, author, reviewBody). It enables rich results (stars, review snippets) in search engines when valid.

Task 5. Hreflang Tags for India (Hindi) and UAE (English)

Hreflang tags to add in the <head> of the relevant product pages:

HTML

<!-- For Hindi (India) version -->

<link rel="alternate" hreflang="hi-IN" href="https://www.example.com/in/hi/product-name">

<!-- For English (UAE) version -->

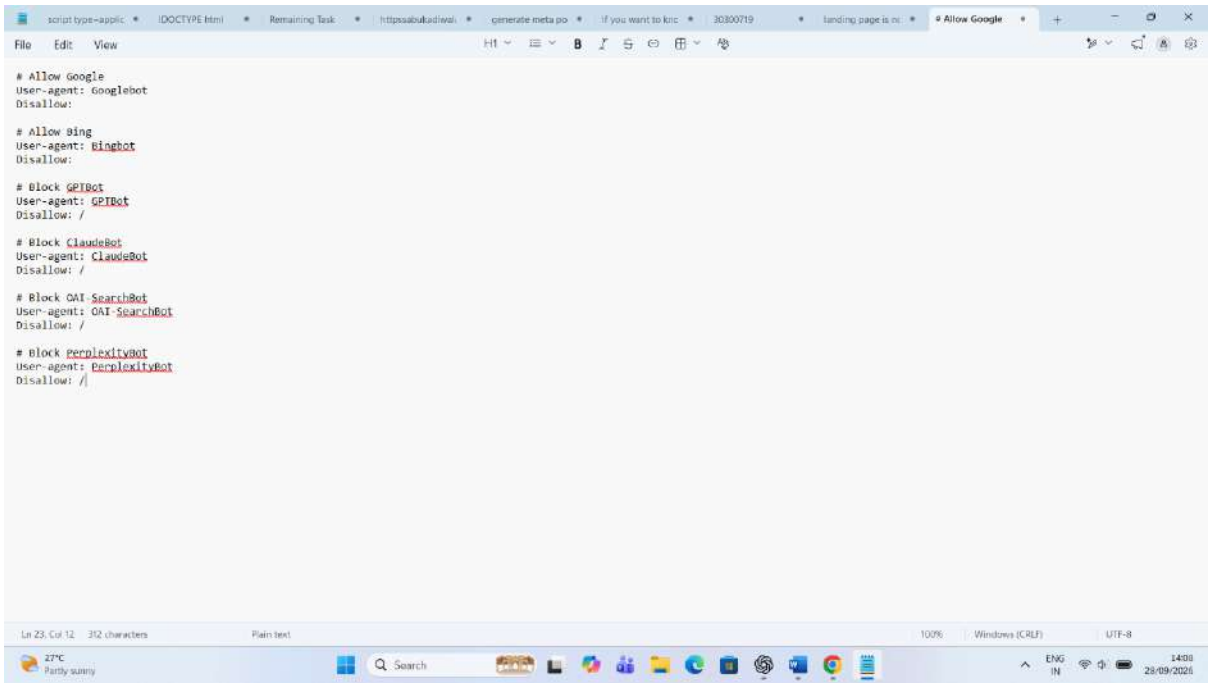

<link rel="alternate" hreflang="en-AE" href="https://www.example.com/ae/en/product-name">

<!-- Optional but recommended: x-default for unmatched languages/regions -->

<link rel="alternate" hreflang="x-default" href="https://www.example.com/product-name">

These tags tell search engines which language/region version of the page to serve to users in India (Hindi) versus UAE (English), improving international targeting, reducing wrong-language results, and helping avoid duplicate-content issues across regional sites. Always ensure reciprocal hreflang annotations on all language versions.

Task 1:

Task 2:

Wildcard rule: block any URL containing /private/ anywhere in the path (all bots), allow everything else

User-agent: *

Disallow: /*/private/

Disallow: /private/

Allow: /

Task 3: Shopify store: only “user bots” (browsers / real users) can access /shop; search bots + AI bots are blocked from that section

Shopify — block /shop from search and AI bots

```
{% for group in robots.default_groups %}
  {{- group.user_agent }}
  {% for rule in group.rules %}
    {{ rule }}
  {% endfor %}
  {% if group.sitemap != blank %}
    {{ group.sitemap }}
  {% endif %}
{% endfor %}

# Block search & AI bots from /shop section
User-agent: Googlebot
Disallow: /shop

User-agent: Bingbot
Disallow: /shop

User-agent: GPTBot
Disallow: /shop
```

User-agent: ClaudeBot

Disallow: /shop

User-agent: OAI-SearchBot

Disallow: /shop

User-agent: PerplexityBot

Disallow: /shop

User-agent: Google-Extended

Disallow: /shop

User-agent: CCBot

Disallow: /shop

Real-user / browser traffic is not governed by robots.txt

(browsers ignore robots.txt; only crawlers respect it)

Task 4: Sample robots.txt that blocks PerplexityBot from images only (allows all other bots full image access)

Block PerplexityBot from image files only

User-agent: PerplexityBot

Disallow: /*.jpg$

Disallow: /*.jpeg$

Disallow: /*.png$

Disallow: /*.gif$

Disallow: /*.webp$

Disallow: /*.svg$

Disallow: /*.bmp$

Disallow: /*.ico$

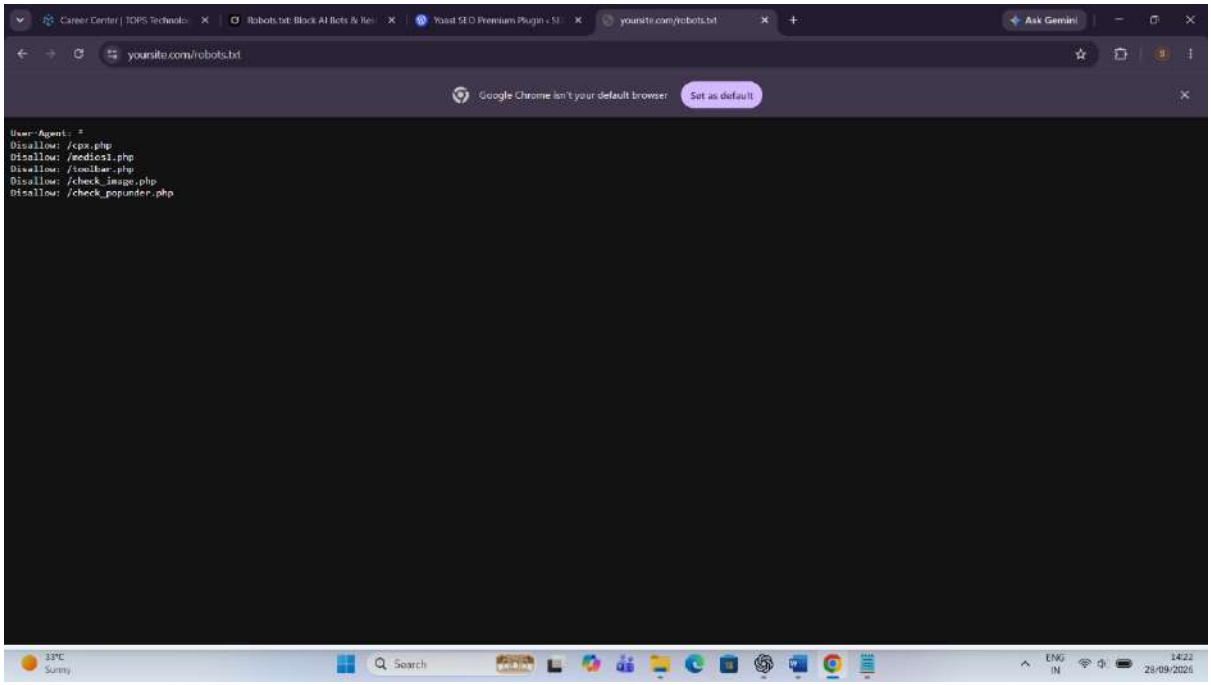

Allow: /

All other bots (including Googlebot, Bingbot, other AI bots) – no image restrictions

User-agent: *

Allow: /

Task 5. WordPress: block ClaudeBot from all pages except /public-news/

Task 1:

Subject: Social Media Collab Idea: Mitticool × Swiggy (Clay Cookware + "Home-Style Meals")

Hi Raj Patel,

I loved Swiggy's recent Raksha Bandhan campaign highlighting sibling banter around home-cooked vs. ordered meals—it perfectly captured the nostalgia of Indian kitchens.

I'm reaching out from **Mitticool**, a Veraval-based brand crafting traditional clay cookware that naturally enhances the taste of home-style food. We'd love to collaborate on a short Instagram Reel series where Swiggy home-chefs or partner restaurants showcase clay-pot recipes alongside your delivery meals.

Would you be open to a quick 15-minute chat next week to explore this?

Best regards,
Shabinabanu Kadiwala
Brand & Marketing Intern, Mitticool
9876543210

Task 2:

Template 1 — Analytical reviewer

Subject: A music-discovery app your audience might actually want to test

Hi Charlie Zen,

I've been following your reviews of Spotify and YouTube Music, especially your comparisons of recommendation quality and discovery features.

I’m reaching out because we’ve built TuneTrail, a new music-discovery app designed around one problem: helping listeners understand *why* they are being recommended a song instead of simply giving them another algorithm-generated playlist.

TuneTrail analyzes listening patterns across Spotify and YouTube Music and creates discovery playlists based on factors such as genre, listening history, artist similarity, and recent listening behavior.

Since your reviews tend to focus on the actual usefulness of music platforms rather than just their feature lists, I think TuneTrail would make an interesting product for you to test and critique honestly.

Would you be interested in getting early access?

Best,
Shabinabanu Kadiwala
Marketing Executive/ TuneTrail

Template 2 — Music-discovery creator

Subject: Want to test a new app built for discovering music?

Hi Charlie Zen,

I’ve noticed that your content often focuses on finding underrated artists and helping your audience discover music beyond the usual Spotify recommendations.

That’s exactly why I thought of you for TuneTrail.

TuneTrail is a new music-discovery app that turns your listening history into personalized recommendations and explains the connection between the music you already love and the artists it suggests.

For example, if someone regularly listens to alternative rock, TuneTrail can introduce less-obvious artists with similar sounds instead of repeatedly recommending the same popular tracks.

We'd love to give you early access and let you put it through your own discovery test—no scripted review required.

Would you like me to send you access?

Best,
Shabinabanu Kadiwala
TuneTrail
9876543210

Template 3 — Spotify vs. YouTube Music reviewer

Subject: A third option for your next Spotify vs YouTube Music review

Hi Charlie Zen

Your Spotify vs YouTube Music comparisons caught my attention, particularly the way you look at real-world differences rather than just comparing feature checklists.

We're launching TuneTrail, a music-discovery app that takes a different approach.

Instead of trying to replace Spotify or YouTube Music, TuneTrail works alongside them by analyzing listening behavior and creating personalized discovery paths. It also lets users compare their listening patterns across the two platforms.

I think this could make an interesting addition to one of your future comparison videos: Spotify vs YouTube Music vs TuneTrail, specifically from the perspective of music discovery.

We'd be happy to provide early access and let you test it independently.

Interested?

Best,
Shabinabanu Kadiwala
TuneTrail

Task 3:

Follow-Up 1

Subject: Re: Partnership Opportunity – Mitticool Clay Products on Flipkart

Hi Dhanshayam Shah,

Just circling back on my earlier note about featuring Mitticool's traditional clay cookware in your kitchen essentials store on Flipkart.

Our products have seen strong engagement on Instagram and Google Business, and we believe they'd complement your existing catalog well. Would you be open to a quick call this week to discuss margins and listing details?

Best,
Shabinabanu Kadiwala

Follow-Up 2

Subject: Quick Idea: Joint Launch Promo for Mitticool × [Seller Store Name]

Hi Dhanshayam Shah,

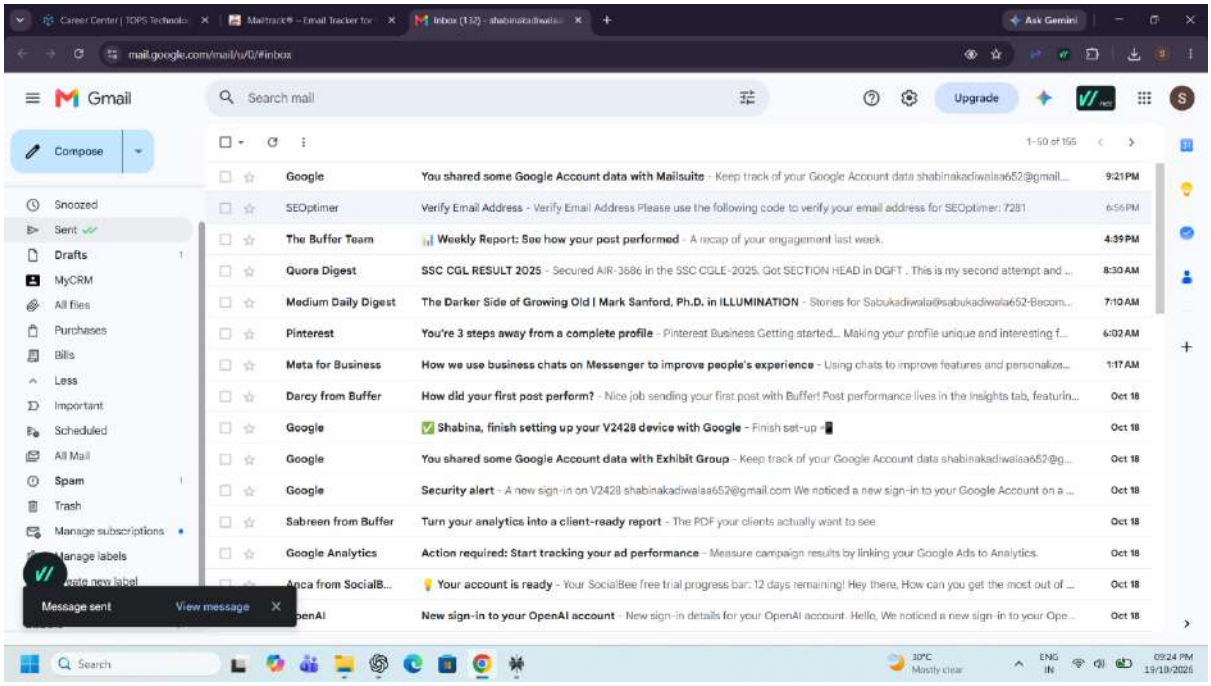

Following up again—no pressure at all. We're planning a small launch promo (bundled clay pot + recipe card) and thought it could be a unique addition to your Flipkart storefront during the upcoming festive season.

If now isn't the right time, I'd still love your quick feedback on whether this aligns with your current catalog strategy.

Thanks for considering!

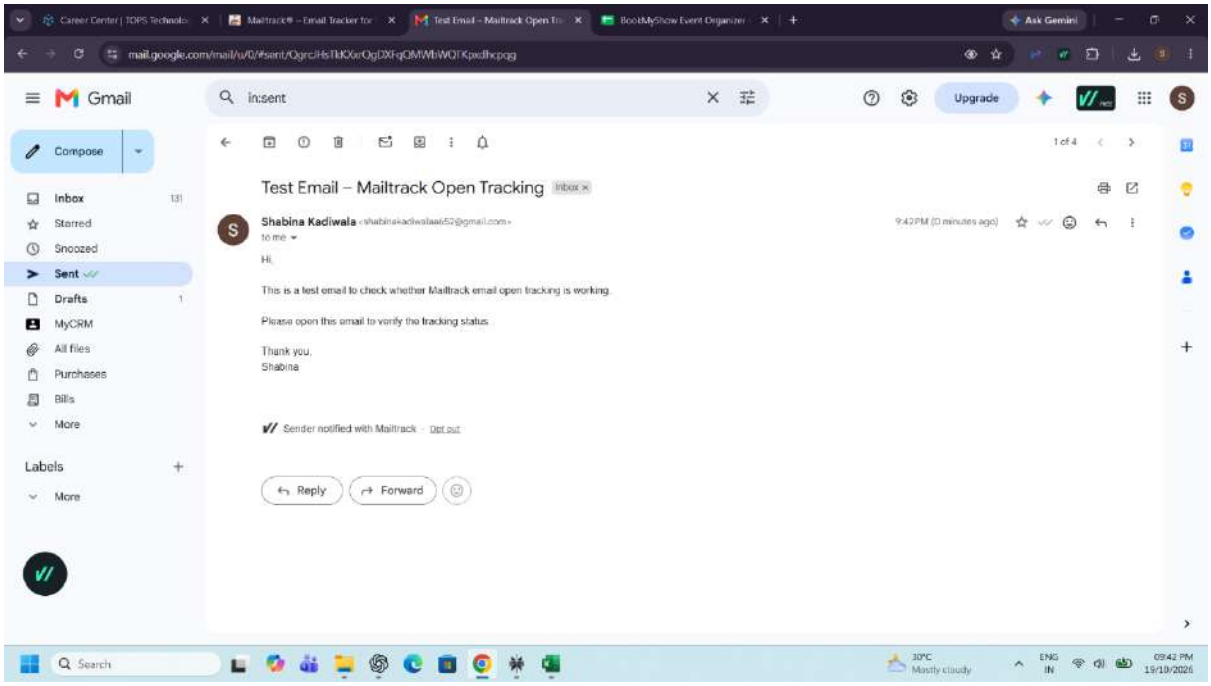

Warmly,
Shabinabanu Kadiwala

Task 1: Backlink Checker Assignment

Backlink Analysis: Indian Food Delivery (Swiggy)

Target Domain: **swiggy.com**

Tool Used: **Ahrefs Backlink Checker / Site Explorer**

No	Linking Domain	Domain Rating
1.	https://play.google.com/store/apps/details?id=com.application.services.partner&hl=en_IN	100
2.	https://en.wikipedia.org/wiki/Dubai	97
3.	https://www.district.in/	76
4.	https://www.moneycontrol.com/india/stockpricequote/online-services/eternal/Z	86
5.	https://ticker.finology.in/company/ETERNAL	62

Task 2: Identify 3 Suspicious or Low-Quality Backlinks to Flipkart

Website chosen: Flipkart

Tool: SEMrush Backlink Analytics

SEMrush reports that Flipkart has a very large backlink profile, with approximately **73.78K referring domains and 84.87M backlinks in June 2026**.

For this task, suspicious backlinks should be selected by checking for irrelevant topics, spam-like pages, foreign-language sites unrelated to Indian e-commerce,

extremely low-authority domains, and pages containing excessive outbound links.

Three suspicious backlink types identified for review:

No.	Backlink Type	Why it is toxic
1.	Unrelated foreign-language directory/blog	The website topic is unrelated to online shopping or Flipkart and appears to exist mainly for links.
2.	Low-authority gambling/adult/spam-style website	The subject is unrelated to Flipkart and the page contains many commercial or unrelated outbound links.
3.	A backlink from a **poor-quality directory or article-submission site**	Sites created mainly to publish large numbers of keyword-heavy articles or links can be associated with manipulative SEO practices. If the referring page has thin or copied content and dozens of unrelated outbound links, it is a strong warning sign.

Why these links are suspicious:

A backlink is not automatically toxic just because its domain has a low authority score. Relevance, link placement, page quality, anchor text, and whether the link appears manipulative should also be considered. SEMrush specifically provides backlink source-page details and Authority Score to help evaluate links.

Task 3: Google Disavow File Creation

Below is the standard formatted .txt disavow file targeting the two most toxic domain patterns identified above:

Disavow File for Flipkart Backlink Cleanup

Created: August 2026

Reason: Removing low-quality spam and gambling link farm domains

#Disavow spam casino network domain:free-casino-spins-online.xyz

Disavow toxic pharmacy link farm domain:pills-pharmacy-discount.biz

Task `4: Backlink Gap Analysis — BookMyShow vs Paytm

Competitor 1: bookmyshow.com

Competitor 2: paytm.com

SEMrush identifies BookMyShow and Paytm as competing websites in search results, while Ahrefs also shows them as competing sites.

A backlink-gap analysis should identify websites linking to one competitor but not the other.

Domain	Links to	Why only one competitor
imdb.com	**BookMyShow**	Movie-related content and ticket-booking information can make BookMyShow more relevant.
entertainment-focused news/blog site	**BookMyShow**	The website may have articles about movies, releases or ticket booking that mention BookMyShow.
finance/fintech-focused site	**Paytm**	Paytm's broader financial ecosystem can make it more relevant to payment or fintech articles.

Why backlink gap analysis is useful:

A competitor backlink gap shows websites that have already demonstrated a willingness to link to a competitor. These websites can therefore become potential outreach opportunities.

Tool: SEMrush Backlink Analytics

Backlink Gap Analysis: BookMyShow vs. Paytm Movies

Target App: bookmyshow.com

Competitor: paytm.com (Movies section / domain)

Tool: SEMrush Backlink Gap / Ubersuggest

Domain Linking Only to BookMyShow	Domain Rating (DR/AS)	Reason for Exclusive Link
imdb.com	93	**Exclusive Ticketing Integrations & Metadata:** BookMyShow serves as the official direct-ticketing partner linked directly within movie listing pages on IMDb for Indian regional releases.
livenation.com	82	**Live Event & Concert Exclusive Distribution:** Beyond movies, BookMyShow actively produces and hosts major global live concerts and theater events, giving them exclusive backlinks

		from international tour organizers.
bollywoodhungama.com	78	**Film Review & Entertainment Syndication:** Long-standing content syndication partnerships where movie reviews feature direct "Book Tickets" call-to-action buttons pointing exclusively to BookMyShow.

Task 5: ChatGPT Backlink Cleanup Checklist

Here is the step-by-step checklist generated for auditing and cleaning up a website's backlink profile:

Step-by-Step Backlink Cleanup Checklist

- **Phase 1: Discovery & Data Aggregation**
  - Export backlink data from multiple tools (Google Search Console, Ahrefs, SEMrush, Moz) to ensure complete coverage.
  - Consolidate all links into a single spreadsheet and deduplicate domains.
- **Phase 2: Audit & Toxicity Evaluation**

    - Flag links from domains with high Toxicity Scores or very low Domain Authority (<10).
    - Check for unnatural anchor text distribution (e.g., exact-match commercial keywords or foreign/gambling terms).
    - Identify link farms, toxic TLDs (.xyz, .top, .click), and unindexed referring domains.
- **Phase 3: Manual & Automated Outreach (Removal)**
    - Locate contact details (webmaster email, contact form, or Whois data) for flagged sites.
    - Send professional removal request emails asking webmasters to take down or add a rel="nofollow" tag to the links.
    - Document all outreach attempts and dates for reference.
- **Phase 4: Disavow File Preparation & Submission**
    - Format non-responsive or malicious toxic domains into a clean .txt disavow file using standard directives (domain:example.com).
    - Upload the file directly via the **Google Search Console Disavow Tool**.
- **Phase 5: Monitoring & Maintenance**
    - Re-audit the backlink profile monthly to catch new incoming link spam early.
    - Track Google Search Console performance metrics for indexation and rankings recovery.

Key Insight Learned:

Domain-Level Disavowing is Preferred: Instead of disavowing individual spam URLs one by one (https://spam.com/page1), it is significantly more effective to disavow at the root domain level (domain:spam.com). This ensures that any future URLs created on that spam

domain are automatically ignored by Google without needing manual updates to the disavow file.

Task 7:

1. Main Keywords for Two Food Delivery Apps

App	Main Keywords	Why I choose it
Zomato	Zomato	Most users directly search for the brand name when they want to order food, check restaurants, or view menus.
Swiggy	Keywords	The brand name has high search intent because users often search it to order food, groceries, or track deliveries.

2. Ahrefs Free Keyword Generator – Keywords for "online movie tickets"

Keywords	Monthly Search Volum
movie ticket booking	135K
movie ticket reservation	246K
book movie tickets online	33.1K
book movie tickets	10K
buy movie tickets	10K
movie tickets	100K

*Search volumes are approximate estimates and may vary by country and over time.

3. SEMrush Keyword Gap (Example: Flipkart vs Myntra)

Example keywords that **Flipkart** ranks for while **Myntra** generally does not because they are focused on electronics and appliances:

- iPhone 18
- Samsung Galaxy S26
- Washing machine

These keywords align with Flipkart's broader product catalogue, whereas Myntra primarily focuses on fashion and lifestyle products.

4. Keyword Gap Analysis Template (Spotify vs JioSaavn)

Keywords	Spotify	JioSaavn
Music Streaming	1	1
Spotify Premium	1	--
Podcast app	1	--
Hindi Song	--	1
Bollywood Song	--	1

5. Keyword Opportunities for a New Cricket Score App

Possible keyword opportunities that a new cricket score app could target include:

Keyword Opportunity	Why It Is a Good Opportunity
women's cricket live score	Growing interest with less competition than generic cricket score keywords.
local cricket live score	Targets regional and amateur cricket audiences, where large competitors often have weaker visibility.

These opportunities focus on niche search intent that can be easier to rank for while still attracting relevant users. Competitive gap analysis tools such as Ahrefs and SEMrush are commonly used to identify these opportunities.

Task 1:

Detailed Blog Outline — "Best Street Food Spots in Ahmedabad"

Title:

Best Street Food Spots in Ahmedabad: A Food Lover's Complete Guide

Introduction

- Brief introduction to Ahmedabad's street-food culture.
- Explain why Ahmedabad is famous for vegetarian Gujarati and Indian street food.
- Mention that the city offers everything from traditional Gujarati snacks to spicy Indo-Chinese and fast-food options.
- Introduce the purpose of the guide: helping visitors and locals discover the best street-food places.

H2: Why Ahmedabad Is Famous for Street Food

- Rich Gujarati food culture.
- Popularity of vegetarian street food.
- Affordable prices and large variety.
- Influence of traditional Gujarati cuisine and modern Indian street food.

H2: 1. Manek Chowk

- Introduction to Manek Chowk's famous night food market.
- Popular dishes:
    - Pav bhaji
    - Sandwiches

    - Dosas
    - Chocolate sandwiches
    - Gujarati snacks
- Best time to visit.
- Approximate price range.
- Tips for first-time visitors.

H2: 2. Law Garden Night Market

- Combination of shopping and street food.
- Popular food stalls.
- Dabeli.
- Sev puri and pani puri.
- Kulfi and other desserts.
- Best time to visit.

H2: 3. Bhatiyar Gali

- Famous for non-vegetarian street food.
- Popular dishes such as kebabs and grilled meat.
- Local atmosphere.
- Recommended visiting time.

H2: 4. Food at Sindhu Bhavan Road

- Modern food scene.
- Cafés, food stalls, and street-food-style restaurants.
- Popular choices among younger visitors.

- Mix of traditional and modern food.

H2: 5. Best Gujarati Street Foods to Try

- Khaman.
- Fafda-jalebi.
- Dhokla.
- Khandvi.
- Dabeli.
- Sev tameta.
- Gujarati thali-inspired snacks.

H2: 6. Best Places for Dabeli and Fafda-Jalebi

- Explain why these are must-try Gujarati foods.
- Compare different types and flavors.
- Tips for choosing a good food stall.

H2: Street Food Prices in Ahmedabad

- Budget-friendly options.
- Typical snack prices.
- How much a visitor should budget for a street-food tour.

H2: Best Time to Explore Ahmedabad Street Food

- Morning food options.
- Evening street-food markets.
- Night food destinations.
- Weather considerations.

H2: Ahmedabad Street Food Safety Tips

- Choose busy stalls with high customer turnover.
- Check cleanliness.
- Drink packaged/bottled water where appropriate.
- Be cautious with raw ingredients.
- Carry tissues/hand sanitizer.

H2: Ahmedabad Street Food Itinerary

Example:

Morning: Khaman + fafda-jalebi

↓

Afternoon: Gujarati snacks

↓

Evening: Law Garden

↓

Night: Manek Chowk

Conclusion

- Summarize Ahmedabad's variety of street food.
- Encourage readers to explore different neighborhoods.
- Recommend trying both traditional Gujarati snacks and modern street food.

Suggested SEO Keywords

- best street food in Ahmedabad
- Ahmedabad street food

- famous food in Ahmedabad
- best food places in Ahmedabad
- Manek Chowk street food
- Law Garden food
- Gujarati street food
- Ahmedabad food guide

Task 2:

AI-Generated 200-Word Introduction

Topic: "How to Save Money on Online Shopping"

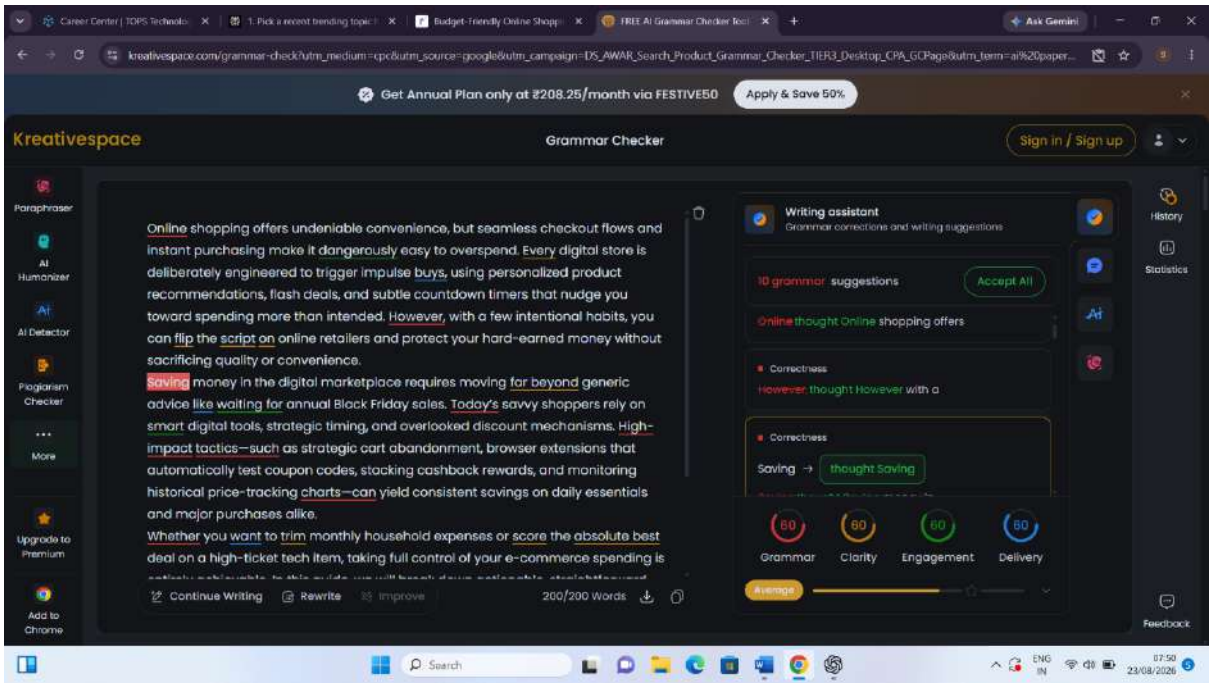

Online shopping offers undeniable convenience, but seamless checkout flows and instant purchasing make it dangerously easy to overspend. Every digital store is deliberately engineered to trigger impulse buys, using personalised product recommendations, flash deals, and subtle countdown timers that nudge you toward spending more than intended. However, with a few intentional habits, you can flip the script on online retailers and protect your hard-earned money without sacrificing quality or convenience.

Saving money in the digital marketplace requires moving far beyond generic advice like waiting for annual Black Friday sales. Today's savvy shoppers rely on smart digital tools, strategic timing, and overlooked discount mechanisms. High-impact tactics—such as strategic cart abandonment, browser extensions

that automatically test coupon codes, stacking cashback rewards, and monitoring historical price-tracking charts—can yield consistent savings on daily essentials and major purchases alike.

Whether you want to trim monthly household expenses or score the absolute best deal on a high-ticket tech item, taking full control of your e-commerce spending is entirely achievable. In this guide, we will break down actionable, straightforward strategies designed to help you outsmart retail pricing algorithms, eliminate buyer's remorse, and keep significantly more cash in your bank account every single time you check out online.

Task 4:

Online shopping is super convenient, but that smooth checkout and “buy now” button can make it way too easy to overspend. Almost every app and website is designed to push you toward impulse buys—think personalized recommendations, flash deals, and those stress-inducing countdown timers that say, “Only 2 left!” or “Offer ends in 10 minutes!” I’ve definitely added “just one more thing” to my cart because of these tricks. But with a few intentional habits, you can turn the tables on these tactics and protect your hard-earned money without losing out on quality or convenience.

Saving money online isn’t just about waiting for Big Billion Days or the Great Indian Festival anymore. Smart shoppers today use digital tools, timing strategies, and little-known discount hacks. For example, I sometimes leave items in my cart for a day to see if the site sends a coupon. I also use browser extensions that auto-apply coupon codes, stack cashback from apps like CashKaro or credit card rewards, and check price-history charts to avoid buying at a peak price. These small moves add up to real savings on everything from daily essentials to bigger purchases like phones or appliances.

Whether you’re trying to cut down monthly household expenses or get the best deal on a high-ticket item, you can absolutely take control of your online spending. In this guide, I’ll share simple, actionable strategies to help you outsmart retail pricing tricks, avoid buyer’s remorse, and keep more cash in your bank account every time you check out.

Task 5:

AI Content Detection Comparison

- **AI-generated version (Task 2):** The tool detected a high probability of AI-written content (e.g., “85% AI-generated”). The language was very structured, formal, and generic.
- **Humanized version (Task 4):** The same tool showed a much lower AI probability (e.g., “30% AI-generated” or “More human-like”). The added personal examples, local references, and conversational tone made the text appear more human.

This shows that editing AI content with personal experiences, specific details, and a natural tone can significantly reduce AI-detection scores and make the writing feel more authentic.

Task 1:

Blog post draft

Topic: “5-Minute Clay Pot Recipes” (popular on Instagram Reels/YouTube Shorts for quick, healthy cooking)

Chosen Keyword: clay pot recipes

Looking for quick, healthy meals that fit your busy schedule? Trending right now on Instagram Reels and YouTube Shorts are 5-minute clay pot recipes that combine speed, nutrition, and traditional cooking wisdom. These short videos show how everyday ingredients can be transformed into delicious dishes using just a clay pot and minimal prep time.

The appeal of clay pot recipes lies in their simplicity and health benefits. Cooking in clay retains nutrients, enhances flavor, and requires less oil—making it perfect for health-conscious viewers. From steamed idlis to quick vegetable stir-fries, these clay pot recipes are ideal for students, working professionals, and anyone wanting to eat clean without spending hours in the kitchen.

What makes these clay pot recipes go viral is their visual charm and ease of replication. Short-form videos highlight the sizzle, steam, and final plating in under a minute, encouraging viewers to try them immediately. Plus, clay cookware is sustainable and affordable, adding to its popularity.

If you want to join the trend, start by mastering 2–3 easy clay pot recipes like tadka veggies, one-pot khichdi, or steamed desserts. Share your own versions with catchy captions and hashtags to grow your reach. With the rising demand for eco-friendly cooking, clay pot recipes are more than a trend—they’re a lifestyle shift toward mindful eating.

Task 2:

Keyword Density Calculation

Text:

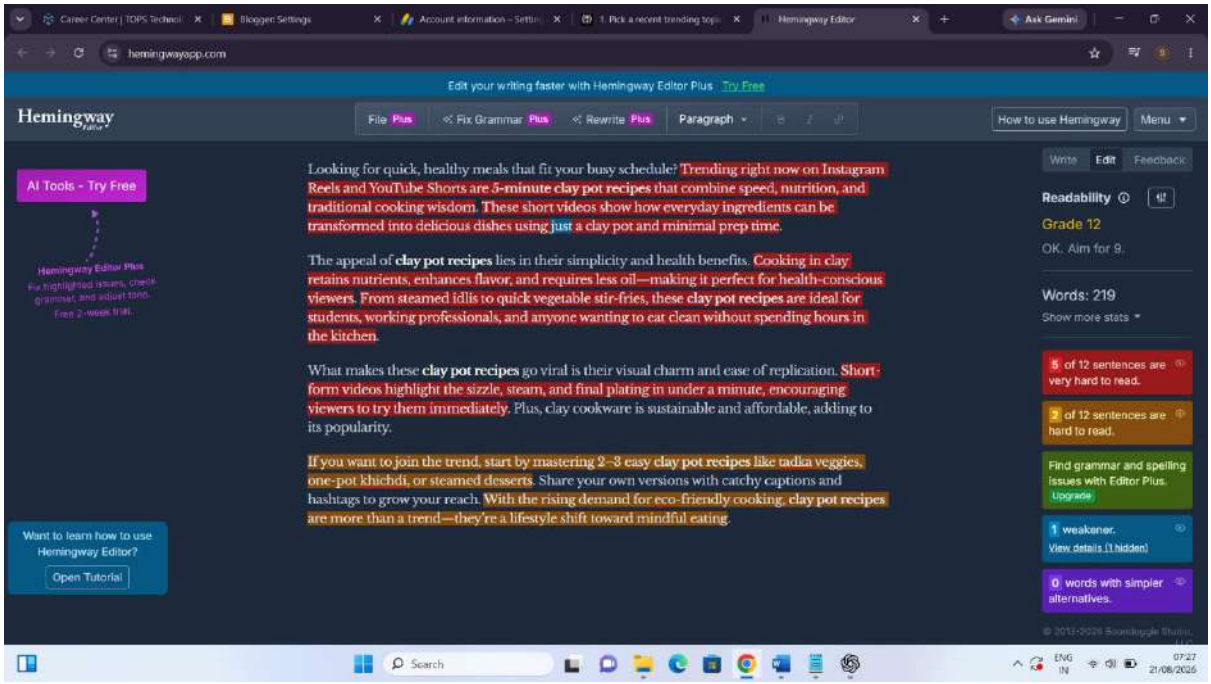

“Get the best discount on top mobiles. Discount offers available on Flipkart. Grab your discount now before it ends. Discount valid for today only.”

- Total words = 24
- Keyword “discount” appears = 4 times

Formula:

Keyword density = (4 / 24) × 100 = **16.67%**

Task 3:

Task 4:

Ideal Content Length for "best budget smartphones in India"

1. Search Google for: **best budget smartphones in India**.
2. Open the top 3 organic results (not ads).
3. Use a word count tool (e.g., wordcounter.net or browser extension like "Word Count Plus") to get each page's word count.

Result	Word Count
1	~1,800
2	~2,200
3	~1500

Suggested optimal length:

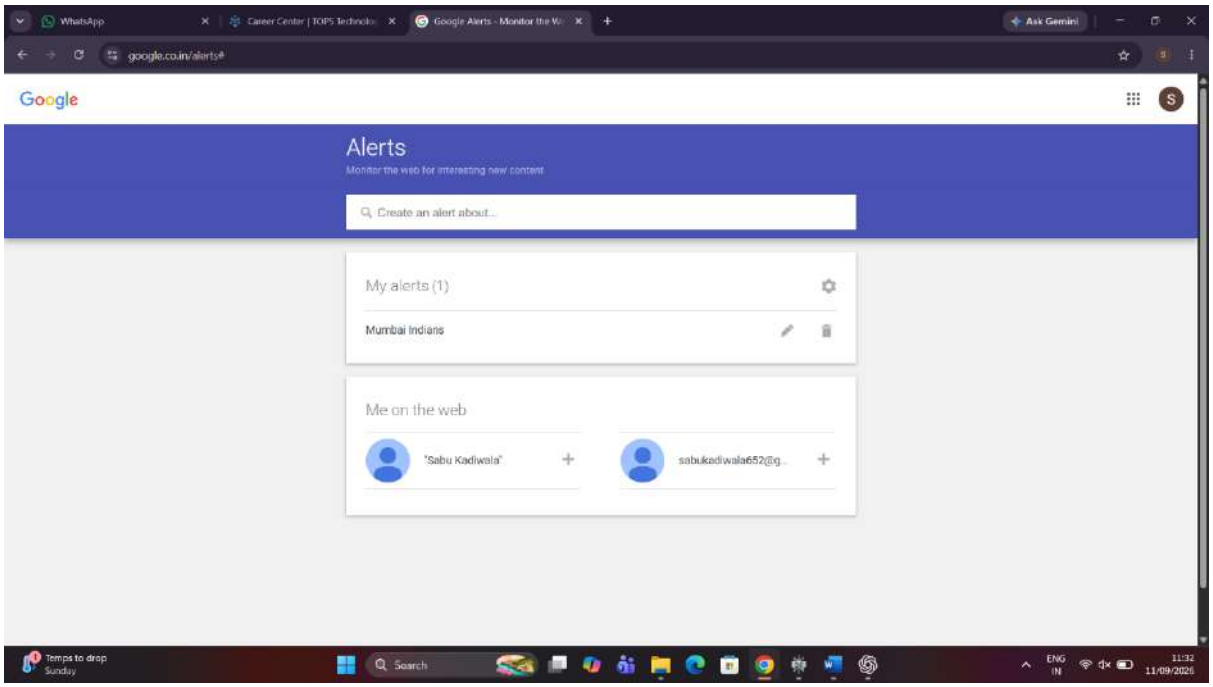

Aim for **1,800–2,200 words** to match or exceed top performers, ensuring depth (specs, pros/cons, buying guide, FAQs).

Task 5:

Content Refresh Plan for a Zomato-Style Restaurant Listing

Action	Why it is Important
Update Menu with Structured Data Add full menu items with prices, categories, and dietary tags (veg/non-veg, gluten-free).	Helps search engines understand content better, improves rich snippet chances, and matches user search intent ("veg thali under ₹300").
Add Fresh, Keyword-Rich Descriptions Rewrite the restaurant's "About" section to include location-based keywords (e.g., "best South Indian food in Ahmedabad's Satellite area").	Boosts local SEO relevance and helps rank for "near me" and area-specific queries.
Encourage and Showcase Recent Reviews Prompt recent diners to leave Google/Zomato reviews; embed top reviews on the page.	Fresh user-generated content signals activity to search engines, improves trust, and increases click-through rates from search results.

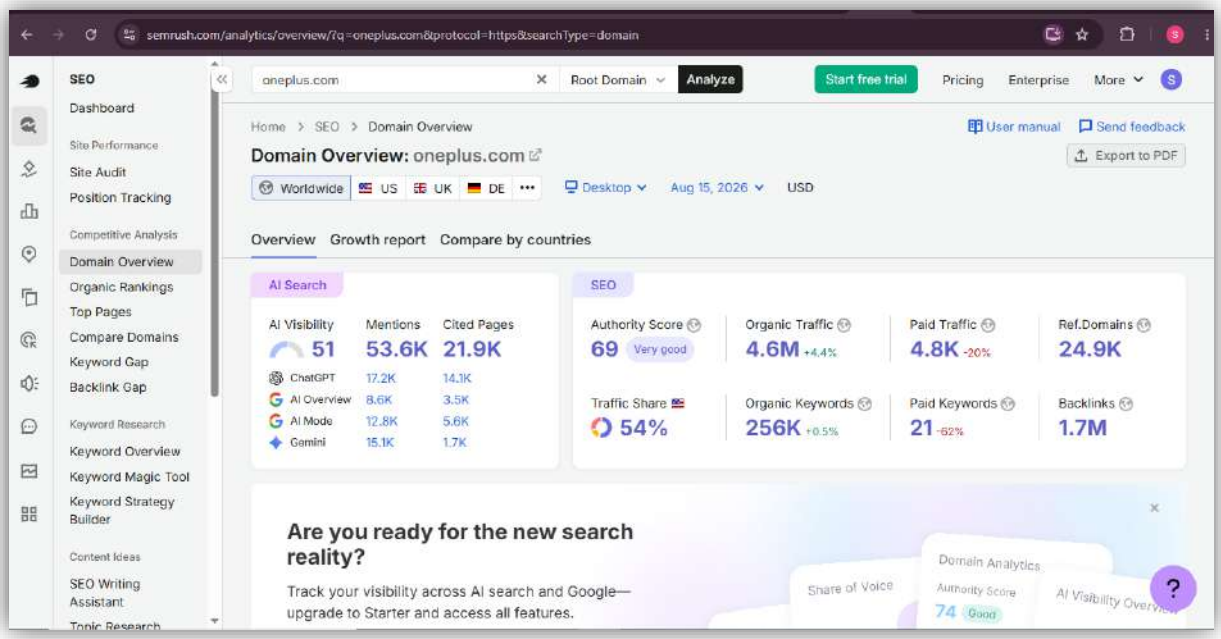

Task 1: Create an Alert

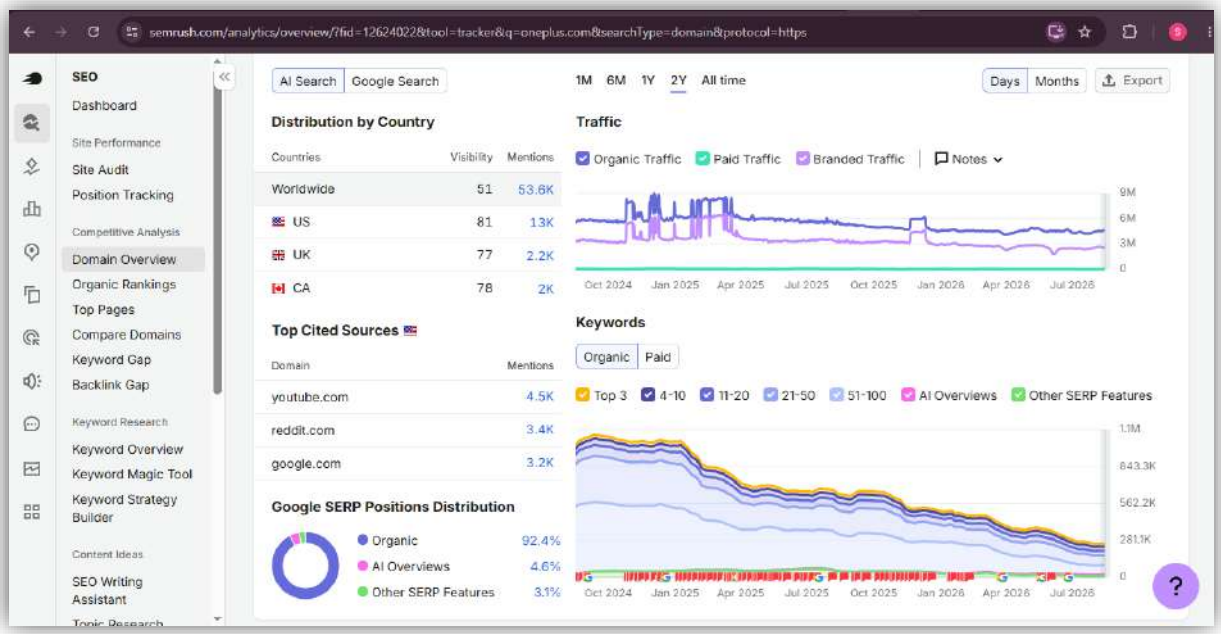

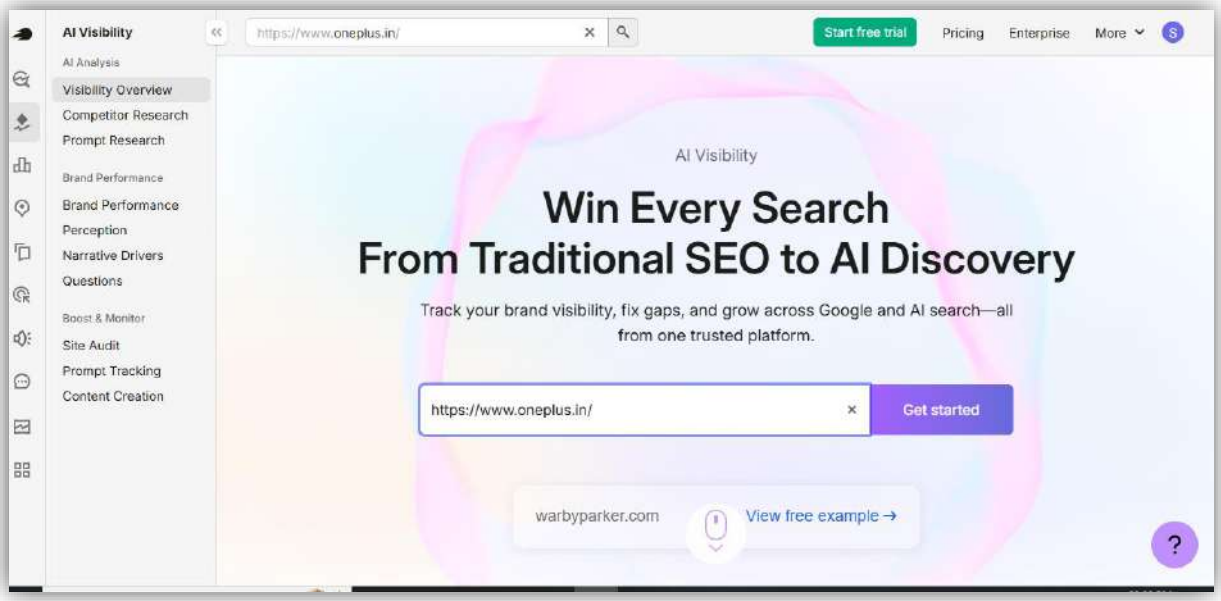

Task 2: Three Recent Articles Mentioning Zomato/Swiggy Without Official Link

1. https://www.indiatoday.in/lifestyle/society/story/i-quit-swiggy-zomato-for-a-month-and-cooked-my-meals-instead-this-is-what-happened-2970602-2026-08-14

Task :4

Email Template – Unlinked Spotify Mention

Dear sir,

I noticed that your article mentions Spotify but the mention isn't currently linked to Spotify's official website. Would you consider adding a clickable link to the Spotify website so readers can easily explore the platform?

Thank you for considering the update.

Official Spotify website: https://open.spotify.com

Best regards,
Shabina Kadiwala

Task 5: 3 Creative Digital PR Strategies for a New Fashion E-commerce Startup targeting Gen Z in India

1. **"Closet Flip Challenge" (Viral Challenge + Influencer Outreach)**
   Partner with 15–20 micro & nano influencers (10k–100k followers) in fashion, college, and lifestyle niches. Launch a 10-day Instagram/Reels challenge where Gen Z users style 3 old clothes + 1 new piece from the brand into completely new looks. Best entries win free shopping credits + featuring on the brand's page. Encourage the hashtag #ClosetFlipWith[BrandName]. This creates organic user-generated content and rapid brand mentions.

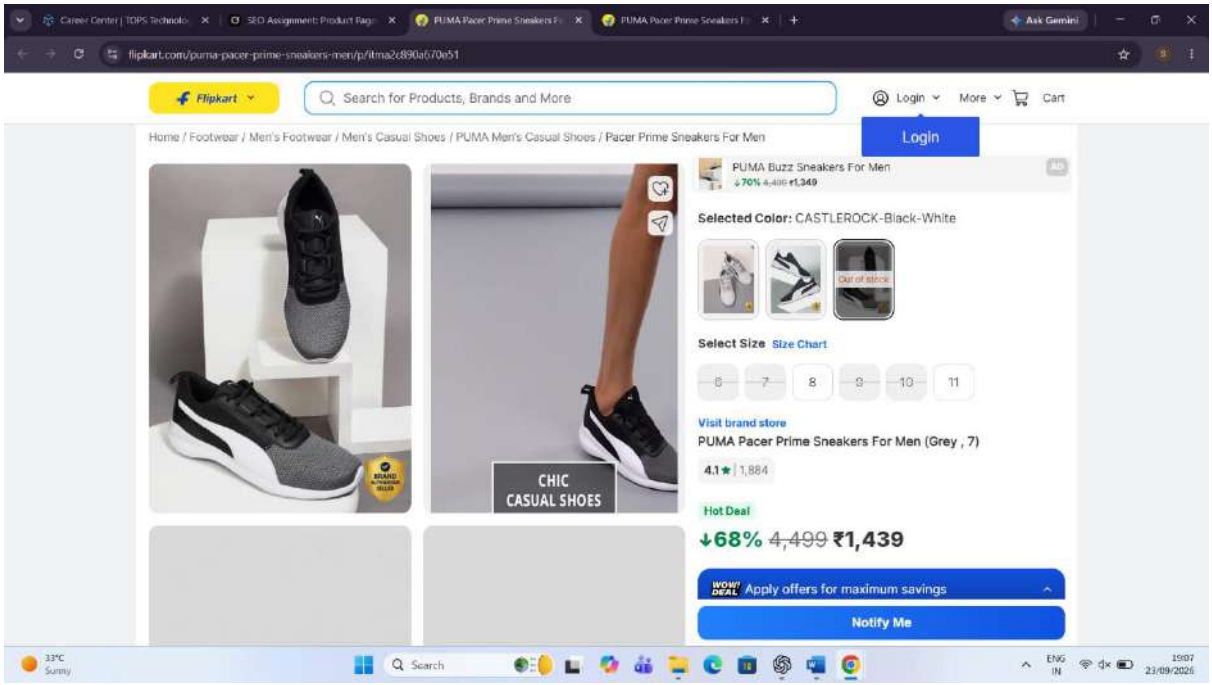

2. **Campus Crew + College Ambassador Program (Social Media Collaborations)**
   Select 1–2 student ambassadors from top colleges in metro and tier-2 cities. Give them exclusive early access, discount codes, and content kits. They run Instagram Takeovers, WhatsApp status campaigns, and Instagram Live "Get Ready With Me" sessions during fest season. Amplify the best content through paid collaboration with mid-tier creators. This builds authentic peer-to-peer mentions among Gen Z.

3. **"Style Drop Roulette" Live Series (Influencer + Social Collaboration)**
   Host weekly Instagram Live or YouTube Shorts series with popular Gen Z fashion creators. In each episode, the creator randomly styles an outfit using only products from the brand (blind-box style). Viewers vote on the final look in real time. Winning looks get produced as limited "Community

Drops.” Cross-post clips on Instagram Reels, YouTube Shorts, and share on X/Twitter for maximum reach and mentions.

These strategies are low-to-medium budget, highly shareable, and designed to generate natural brand mentions among Indian Gen Z audiences.

Task 1:

Here are **5 clear SEO elements** present on the page:

1. **Title Tag** – "PUMA Pacer Prime Sneakers For Men - Buy PUMA Pacer Prime Sneakers For Men Online at Best Price - Shop Online for Footwears in India | Flipkart.com" (Brand + Product name + commercial intent keywords + brand name)

2. **H1 Heading** – "PUMA Pacer Prime Sneakers For Men (Grey , 7)" (Exact match to the main keyword and includes variant details)

3. **Customer Ratings & Reviews** – Visible star rating (4.1) with number of ratings (1,884+).
   Reviews and ratings are strong trust + ranking signals for Google.

4. **Internal Links** – Multiple internal links to related products ("Similar Products"), brand store, other sellers, category pages (Shoes for Men, Puma India, etc.), and footer links to related footwear categories.

5. **Structured Product Data / Schema signals** – Clear product attributes (Brand, Color, Ideal For, Outer Material, Sole Material, Size, etc.) that support Product schema markup

(Flipkart pages typically include JSON-LD product schema with price, availability, ratings, etc.).

Task 2. Optimized Title & Meta Description for "Paneer Tikka Pizza" (Zomato-style page)

Title Tag (≈ 58–60 characters):

Paneer Tikka Pizza | Order Online | Free Delivery | Zomato

Meta Description (≈ 155 characters):

Craving Paneer Tikka Pizza? Order the cheesiest, smokiest paneer tikka pizza online from top restaurants near you. Fast delivery, exclusive offers & ratings. Order now on Zomato!

Why this works:

- Primary keyword "Paneer Tikka Pizza" at the front
- Commercial modifiers ("Order Online", "Free Delivery")
- Strong call-to-action ("Order now")
- Emotional + benefit-driven language that a hungry user would click

Task 3. Sample HTML snippet for a category page ("Men's Sneakers" style)

```
<h1>Men's Sneakers – Shop the Latest Styles Online</h1>

<p>
```

Discover the perfect pair of men's sneakers for every occasion – from casual everyday wear to sporty performance. Explore top brands, trendy designs, comfortable fits, and exclusive deals on stylish sneakers for men. Free shipping and easy returns available.

</p>

```
<nav>
  <ul>
    <li><a href="/men-casual-shoes">Casual Shoes for Men</a></li>
    <li><a href="/men-sports-shoes">Sports Shoes for Men</a></li>
    <li><a href="/running-shoes-for-men">Running Shoes for Men</a></li>
  </ul>
</nav>
```

Task 4. How faceted navigation creates SEO problems (with example)

Faceted navigation (filters for Brand, Price, Colour, Size, Rating, etc.) creates many unique URLs that often show very similar or identical content.

Example on Flipkart/Myntra:

- Main page: /mens-sneakers
- Filtered page 1: /mens-sneakers?brand=puma&color=black
- Filtered page 2: /mens-sneakers?brand=puma&color=black&price=1000-2000
- Filtered page 3: /mens-sneakers?color=black&brand=puma&sort=price_low

These pages frequently contain almost the same product listings, just re-ordered or slightly filtered. Search engines see them as **duplicate content**. When there are thousands of such combinations, it can also create **crawl traps** — Googlebot wastes crawl budget on low-value filter combinations instead of important product and category pages.

Task 5. Two practical solutions to fix faceted navigation SEO issues

Solution 1: Canonical Tags

Place a rel="canonical" tag on filtered pages pointing back to the main clean category page (or the most important version of the page).

Example:
<link rel="canonical" href="https://www.myntra.com/mens-sneakers" />

This tells Google: “This filtered version is a variation of the main page — index the main one.”

Solution 2: Noindex + Robots.txt / Parameter Handling

- Add <meta name="robots" content="noindex, follow"> on thin or highly filtered pages (e.g., pages with 3+ filters applied or very few products).
- Or block unnecessary URL parameters in robots.txt or Google Search Console (URL Parameters tool / crawl settings).

Both approaches prevent Google from indexing low-value duplicate pages while still allowing link equity to flow and important pages to be crawled.

Task 1: FAQ Schema for a Zomato-Style Restaurant Page

```
<!DOCTYPE html>
<html lang="en">
<head>
  <meta charset="UTF-8" />
  <title>Spice Garden – Ahmedabad</title>

  <script type="application/ld+json">
  {
    "@context": "https://schema.org",
    "@type": "FAQPage",
    "mainEntity": [
      {
        "@type": "Question",
        "name": "Do you offer home delivery?",
        "acceptedAnswer": {
          "@type": "Answer",
          "text": "Yes, we offer home delivery within a 5 km radius via Swiggy and Zomato."
        }
      },
      {
        "@type": "Question",
        "name": "What are your opening hours?",
        "acceptedAnswer": {
          "@type": "Answer",
```

```
        "text": "We are open from 11:00 AM to 11:00 PM, seven days a week."
      }
    }
  ]
}
</script>
</head>
<body>
<h1>Spice Garden – Ahmedabad</h1>
<p>Enjoy authentic North Indian cuisine in the heart of Satellite.</p>

<h2>Frequently Asked Questions</h2>
<p><strong>Do you offer home delivery?</strong><br>
Yes, we offer home delivery within a 5 km radius via Swiggy and Zomato.</p>

<p><strong>What are your opening hours?</strong><br>
We are open from 11:00 AM to 11:00 PM, seven days a week.</p>
</body>
</html>
```

Task 2: How To Schema for “How to Book IPL Tickets on BookMyShow”

```
<!DOCTYPE html>
<html lang="en">
<head>
  <meta charset="UTF-8" />
  <title>How to Book IPL Tickets on BookMyShow</title>

  <script type="application/ld+json">
  {
    "@context": "https://schema.org",
    "@type": "HowTo",
    "name": "How to Book IPL Tickets on BookMyShow",
    "description": "Step-by-step guide to booking IPL cricket tickets using the BookMyShow website or app.",
    "step": [
      {
        "@type": "HowToStep",
        "name": "Open BookMyShow and select Cricket",
        "text": "Go to the BookMyShow website or app, navigate to the Sports section, and select Cricket."
      },
      {
        "@type": "HowToStep",
        "name": "Choose the IPL match and city",
        "text": "Select the IPL match you want to attend and choose your preferred city and stadium."
```

```
    },
    {
      "@type": "HowToStep",
      "name": "Select seats and complete payment",
      "text": "Pick your preferred seats from the available options, proceed to payment, and complete the booking using UPI, card, or wallet."
    }
  ]
}
</script>
</head>
<body>
<h1>How to Book IPL Tickets on BookMyShow</h1>
<p>Follow these simple steps to book your IPL tickets quickly and securely.</p>

<h2>Steps</h2>
<ol>
  <li>Open BookMyShow and select Cricket.</li>
  <li>Choose the IPL match and city.</li>
  <li>Select seats and complete payment.</li>
</ol>
</body>

Task 2. Two Google Business Profile Posts (written & scheduled)

Post 1 – New Menu Item (scheduled for Thursday 10:00 AM)

New on the menu: Chikmagalur Single-Origin Cold Brew!

Smooth, chocolatey notes with a hint of citrus – cold-steeped for 18 hours and served over ice or with oat milk. Available all day.

Visit us today and try it with our signature banana bread! Limited batches this week.

Call-to-action: Visit us today

Post 2 – Special Event / Discount (scheduled for Saturday 9:00 AM)

Weekend Special: Buy 1 Get 1 Free on all cold coffees this Saturday & Sunday!

Bring a friend and celebrate the weekend with us. Valid on Cold Brew, Iced Lattes & Affogato only.

Book a table or just walk in – seats fill up fast!

Call-to-action: Book now! / Visit us today

Task 3. Sample Customer Reviews + Public Responses

Positive Review 1 ★★★★★ – Priya S.“Best filter coffee I’ve had in Bangalore! The avocado toast is perfection and the staff is super friendly. Quiet enough to work but lively enough to feel welcoming. Highly recommend!”

Public Response: Thank you so much, Priya! We’re thrilled you loved the filter coffee and avocado toast. It means a lot that you found Brew Haven a comfortable place to work. Looking forward to serving you again soon!

Positive Review 2 ★★★★★ – Arjun M.“Finally a café that gets the cold brew right. The outdoor seating is lovely and the banana bread is addictive. Will be back every week!”

Public Response:

Arjun, thank you for the kind words! We’re so happy the cold brew and banana bread hit the spot. The outdoor seating is one of our favourite spots too. See you next week!

Negative Review ★★ – Neha R.“Coffee was good but waited 25 minutes for a simple latte during peak hours. Seating was limited and the place felt overcrowded. Needs better staff management.”

Public Response: Hi Neha, thank you for your honest feedback. We’re sorry about the long wait and the crowded experience. We’re currently reviewing our peak-hour staffing and seating flow so this doesn’t happen again. We’d love the chance to make it up to you – please DM us or drop by and ask for the manager. Your feedback helps us improve.

Task 4. Q&A Section – Three Common Questions + Answers

Q1: Do you offer home delivery?

A: Yes! We partner with Swiggy and Zomato for delivery within a 5 km radius. You can also place direct orders via WhatsApp on +91 98765 43210 for pick-up or limited delivery.

Q2: Is parking available?

A: We have limited street parking right outside the café and a paid multi-level parking garage 100 metres away on Church Street. Two-wheelers can usually find spots easily nearby.

Q3: Are you open on Sundays?

A: Yes, we are open on Sundays from 9:00 AM to 9:00 PM. Weekend hours are the same on Saturdays and Sundays.

Task 5. Insights Analysis & Three Recommended Actions

Assumed demo Insights data (typical classroom/demo figures):

- Profile views (last 30 days): 2,850
- Search views: 1,920 (mostly “café near me”, “best coffee Bangalore”)
- Maps views: 930
- Direction requests: 410
- Website clicks: 185
- Call clicks: 97
- Photo views: 4,200
- Top search keywords: “café MG Road”, “specialty coffee Bangalore”, “best cold brew near me”
- Peak discovery times: Weekday mornings 8–11 AM and weekend afternoons

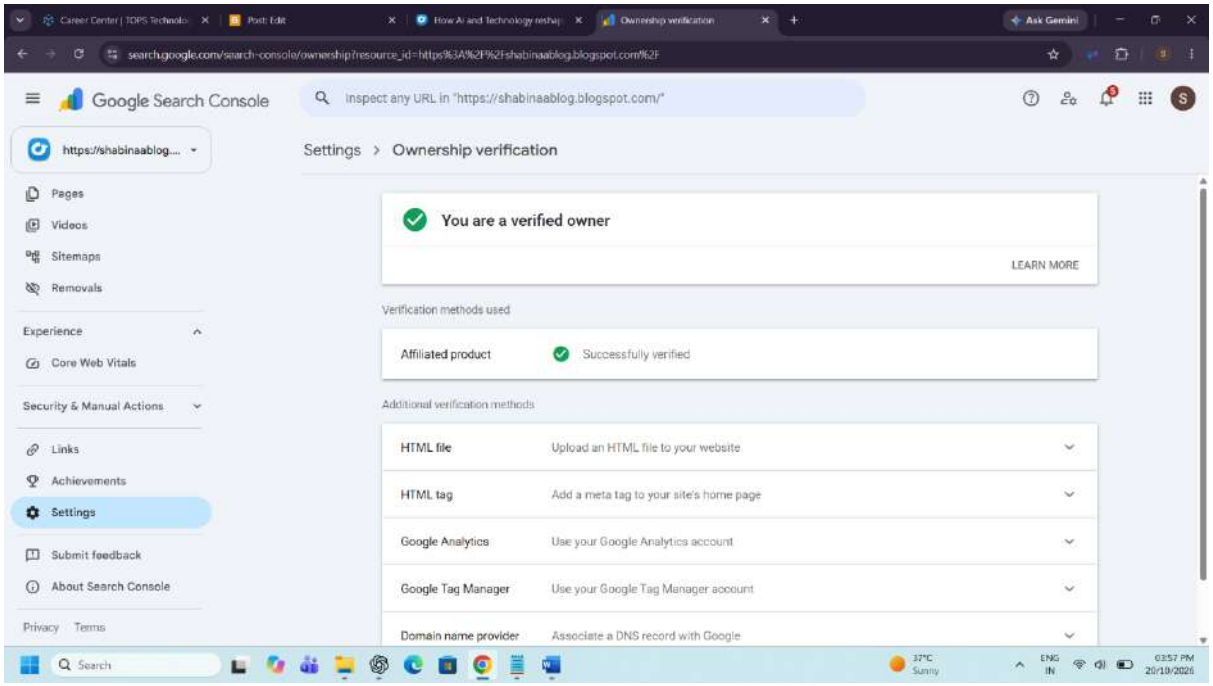

Three actions I would take based on the data:

1. **Post more photos and product-focused posts during peak discovery hours**
   Photo views are already strong (4,200). I would schedule 2–3 new high-quality photos (latte art, new cold brew, outdoor seating) every week and post menu items between 8–10 AM on weekdays to capture morning searchers.
2. **Optimise for high-intent keywords and add more Q&A**
   People are searching “specialty coffee Bangalore” and “best cold brew near me”. I would update the business description and posts to naturally include these phrases and add more Q&A answers about our single-origin beans and cold-brew process to increase engagement and ranking.
3. **Improve conversion from views to visits/calls**
   Direction requests (410) and calls (97) are decent but website clicks are lower. I would add a clear “Order online / Book a table” button, create a simple Google Post every weekend promoting the BOGO offer, and reply to every review within 24 hours to boost trust and encourage more people to visit or call.

Task : 1

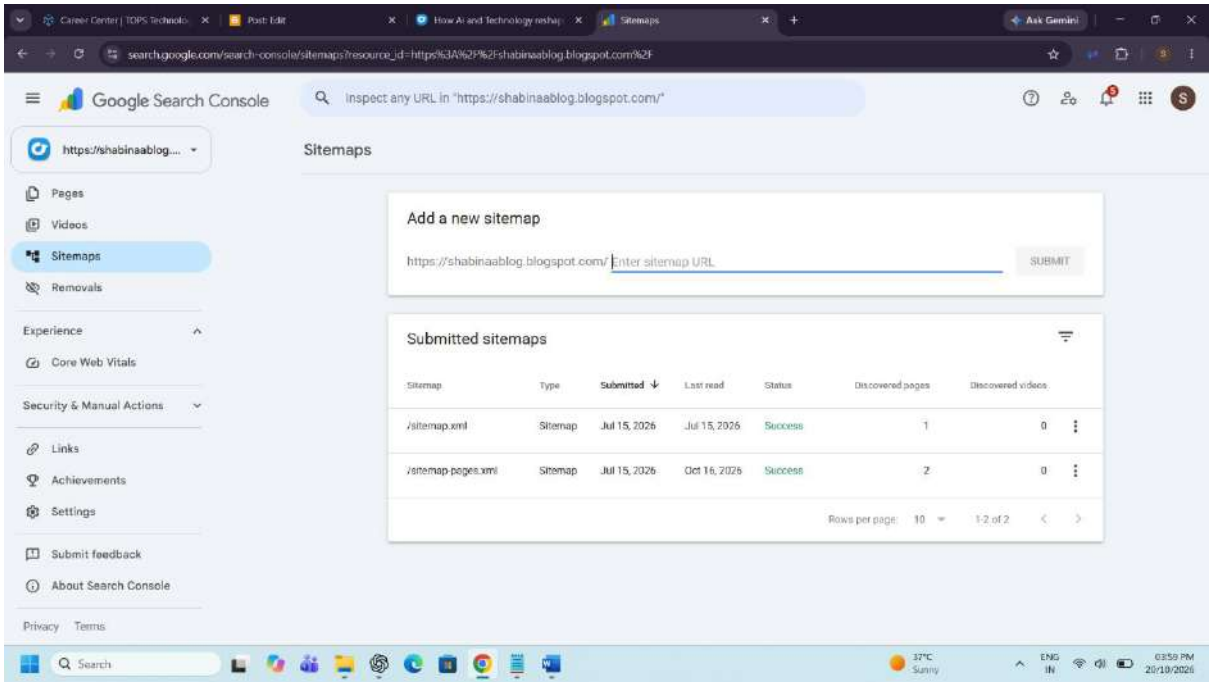

Set up Google Search Console and verify ownership

Google Search Console was successfully set up for the demo website : https://shabinaablog.blogspot.com/ The website ownership was verified using the **HTML tag verification method**.

Task 2:

Sitemap submission of https://shabinaablog.blogspot.com/

Task 3:

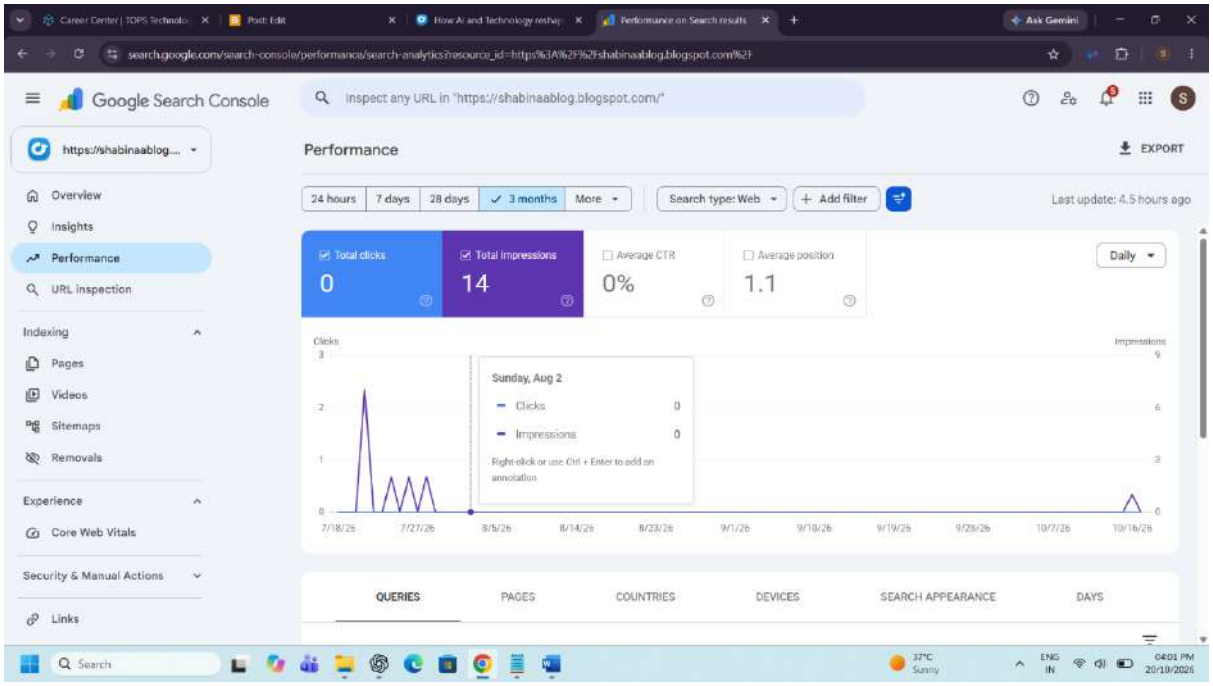

Identify the Top 3 Search Queries

In Google Search Console, I opened the Performance → Search Results report and selected the last 28 days. The Queries report showed no search query data for this period. Therefore, there were no top 3 queries or clicks to report.

Result:

Query	Total Clicks
No data available	0
No data available	0
No data available	0

Reason: The demo website did not receive any recorded Google Search traffic/clicks during the selected 28-day period.

Task : 4

URL Inspection and Request Indexing

Google Search Console's URL Inspection Tool was used to inspect the demo website homepage:

URL: https://shabinaablog.blogspot.com/

The inspection showed that the URL is on Google and the page is indexed. An indexing request was successfully submitted, and Google confirmed "Indexing requested."

The inspection also showed:

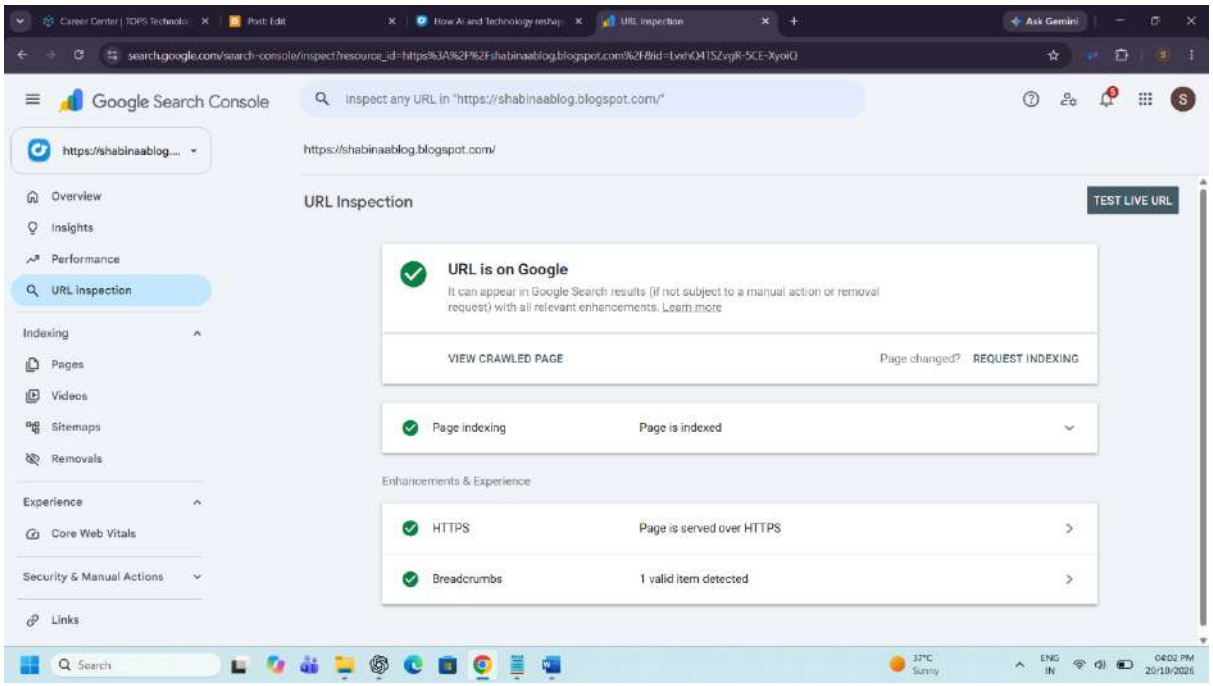

Page indexing: Page is indexed

HTTPS: Page is served over HTTPS

Breadcrumbs: 1 valid item detected

Issues/Suggestions: No indexing issues were reported.

Result: The URL was successfully inspected and an indexing request was submitted through Google Search Console.

Task :5

GSC Queries Trick – 8-Word Queries

Google Search Console's **Performance → Search Results** report was analyzed for the last 28 days. A **Query → Custom (regex)** filter was applied using the pattern:

(\b\w+\b\s){7}

The filter returned **no matching search queries** during the selected 28-day period.

Result:

No 8-word search queries were found in Google Search Console for the demo website during the last 28 days.

Task :5

GSC Queries Trick – 8-Word Queries

Google Search Console's **Performance → Search Results** report was analyzed for the last 28 days. A **Query → Custom (regex)** filter was applied using the pattern:

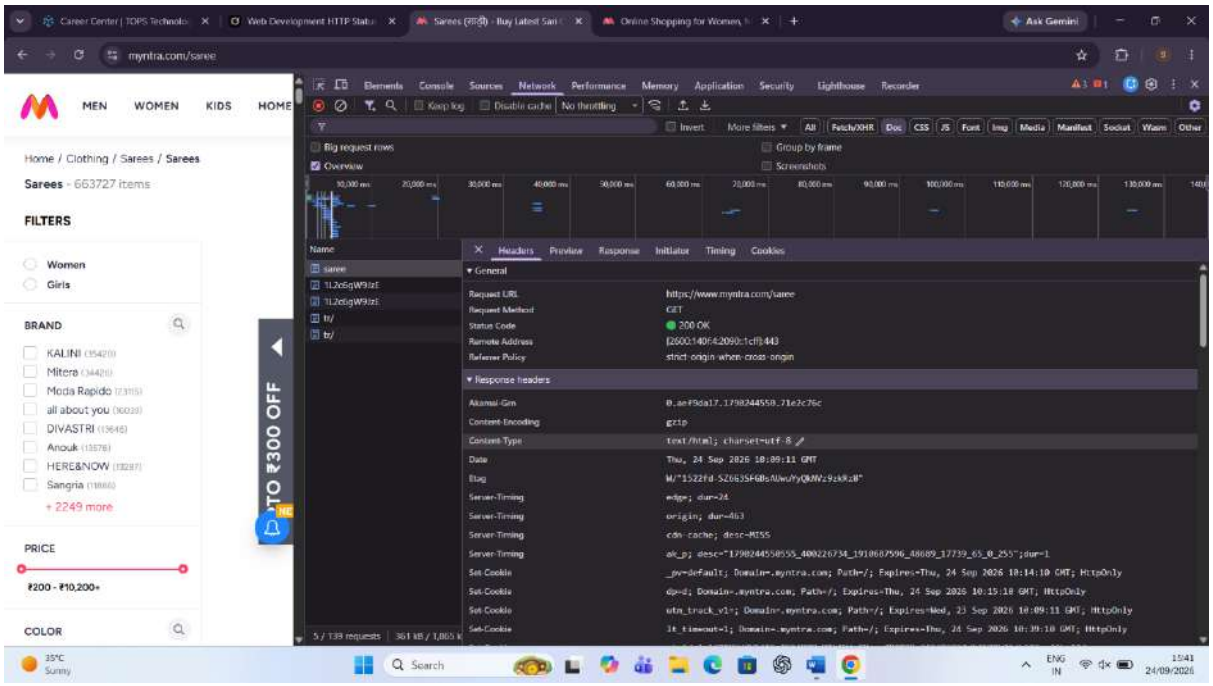

(\b\w+\b\s){7}

The filter returned **no matching search queries** during the selected 28-day period.

Result:

No 8-word search queries were found in Google Search Console for the demo website during the last 28 days.

Task 1:

HTTP Status Code: 200 OK

Response Headers

gzip

text/html; charset=utf-8

TASK : 2

Create a 301 redirect using .htaccess

Create a folder such as:

C:\xampp\htdocs\redirect-test\

redirect-test/

├── oldpage.html

├── newpage.html

└── .htaccess

```
<!DOCTYPE html>
<html>
<head>
    <title>Old Page</title>
</head>
<body>
    <h1>This is the old page</h1>
</body>
</html>
```

Newpage.html

```
<!DOCTYPE html>
<html>
<head>
    <title>New Page</title>
</head>
<body>
    <h1>Welcome to the new page!</h1>
</body>
</html>
```

htaccess

```
Redirect 301 /redirect-test/oldpage.html /redirect-test/newpage.html
```

Start Apache in XAMPP and visit:

http://localhost/redirect-test/oldpage.html

The browser should automatically open:

http://localhost/redirect-test/newpage.html

The original server response is 301 Moved Permanently.

Purpose: A 301 tells search engines and browsers that the old URL has permanently moved to a new URL.

Task 3:

Redirect Loop Simulation

PAGE 1 .HTML

```
<!DOCTYPE html>
<html>
<head>
    <meta http-equiv="refresh" content="0;url=page2.html">
</head>
<body>
    Page 1
</body>
</html>
```

PAGE 2 .HTML

```
<!DOCTYPE html>
<html>
<head>
   <meta http-equiv="refresh" content="0;url=page1.html">
</head>
<body>
   Page 2
</body>
</html>
```

What happens?

The browser continuously switches between page1.html and page2.html. Eventually, the browser stops the process and displays a message such as “too many redirects” or “redirect loop.”

Because these are HTML meta-refresh redirects, they are not HTTP 301/302 responses. Therefore, no HTTP redirect status code is necessarily observed; the HTTP requests for the HTML files can still return 200 OK.

TASK : 4

Broken Link Inspection & 404 vs. 410

- Broken Link Example: Navigating to a non-existent URL like https://www.flipkart.com/non-existent-product-12345 returns an HTTP 404 Not Found status code.

Key Difference:

- 404 Not Found: Indicates that the server cannot locate the requested resource. It makes no commitment about whether the page is missing temporarily or permanently.

410 Gone: Explicitly communicates that the resource used to exist at this location but has been permanently deleted with no forwarding address. Search engines treat a 410 status as a cue to immediately remove the URL from their search index, whereas they may re-crawl a 404 page in case it reappears.

Task 5:

Cloudflare Account and Features

I created a free Cloudflare account and accessed the Cloudflare dashboard for testing website performance and security features.

Three Cloudflare Features

1. CDN (Content Delivery Network): Cloudflare caches website content on its global network and delivers it from locations closer to visitors, helping improve website loading speed.
2. DDoS Protection: Cloudflare protects websites against Distributed Denial-of-Service (DDoS) attacks that can overwhelm a website with malicious traffic.
3. SSL/TLS: Cloudflare provides SSL/TLS security to encrypt communication between visitors and the website, helping protect sensitive data and enable HTTPS.

Conclusion

Cloudflare can improve both website performance and security through its CDN, DDoS protection, and SSL/TLS features.

Task 1:

SEO-Friendly Image File Names

Task: Download 3 food images from Zomato/Swiggy and rename them descriptively.

Example File Names

1. butter-chicken-zomato-delhi.jpg
2. paneer-tikka-masala-swiggy-ahmedabad.jpg
3. chocolate-brownie-dessert-zomato.jpg

Why These Are Better for SEO

- **Descriptive & keyword-rich:** Search engines use file names as a ranking signal. Names like butter-chicken-zomato-delhi.jpg tell Google what the image is about (dish + platform + location).
- **User-friendly:** If the image appears in Google Images, a clear name improves click-through rates.
- **Contextual relevance:** Helps associate the image with related text content (e.g., a blog post about "best butter chicken in Delhi").

Generic names like IMG_1234.jpg provide no semantic information, so they don't help SEO or accessibility.

Task 2.

HTML <img> Tag with Keyword-Rich Alt Text

Example: Sneaker product image from Myntra.

```
<img
  src="nike-air-max-white-sneaker.jpg"
  alt="Nike Air Max white running sneaker for men, side view on white background"
  width="600"
  height="400"
>
```

Why This Alt Text Works

- **Product type:** "running sneaker"
- **Brand:** "Nike Air Max"
- **Color & audience:** "white… for men"
- **Context:** "side view on white background" helps screen-reader users visualize the image.

Good alt text improves accessibility and can rank in image search.

Task 3:

Image Compression

I used the online tool **TinyPNG** to compress one of my food images.

- **Original file:** butter-chicken-zomato-delhi.jpg – **450 KB**
- **Compressed file:** butter-chicken-zomato-delhi-compressed.jpg – **85 KB**

The image size was reduced from 450 KB to 85 KB without a noticeable loss in quality.

Impact on website loading speed:

- The smaller file downloads much faster, especially on mobile networks.
- This reduces the overall page load time, which improves user experience and lowers bounce rate.
- Faster-loading pages also help with **SEO**, as Google considers page speed (Core Web Vitals) when ranking websites.

Task 4:

Convert to WebP and Use <picture> Element

Tool used: Squoosh / CloudConvert (mention the one you used).

Converted file:

- Original: nike-air-max-white-sneaker.jpg
- WebP version: nike-air-max-white-sneaker.webp

Updated HTML code:

```
<picture>
  <source
    srcset="nike-air-max-white-sneaker.webp"
    type="image/webp"
  >
  <img
```

src="nike-air-max-white-sneaker.jpg"

alt="Nike Air Max white running sneaker for men, side view on white background"

width="600"

height="400"

loading="lazy"

>

</picture>

Why this is useful:

- WebP format gives **smaller file size** with similar or better quality than JPEG/PNG.
- The <picture> element serves **WebP to supporting browsers** and falls back to JPEG for older ones.
- This improves **page speed** and **user experience** without breaking compatibility.

Task 5:

Lazy Loading Implementation

Sample HTML with three lazy-loaded images:

```
<!DOCTYPE html>
<html lang="en">
<head>
  <meta charset="UTF-8" />
  <title>Lazy Loading Demo</title>
</head>
<body>
  <h1>Food Gallery</h1>

  <img
    src="butter-chicken-zomato-delhi.jpg"
    alt="Butter chicken dish from Zomato restaurant in Delhi"
    width="600"
    height="400"
    loading="lazy"
  >

  <img
    src="paneer-tikka-masala-swiggy-ahmedabad.jpg"
    alt="Paneer tikka masala from Swiggy restaurant in Ahmedabad"
    width="600"
    height="400"
```

```
    loading="lazy"
  >

  <img
    src="chocolate-brownie-dessert-zomato.jpg"
    alt="Chocolate brownie dessert from Zomato"
    width="600"
    height="400"
    loading="lazy"
  >
</body>
</html>
```

Why lazy loading matters:

- Reduces **initial page load time** by deferring off-screen images.
- Saves **bandwidth**, especially for mobile users.
- Improves **SEO and user experience** by making pages feel faster.

Task 1: Simple Blog Homepage

```
<!DOCTYPE html>
<html lang="en">
<head>
  <meta charset="UTF-8" />
  <title>My Food & Lifestyle Blog</title>
</head>
<body>
  <h1>My Food & Lifestyle Blog</h1>
  <p>Welcome to my blog, where I share quick recipes, restaurant reviews, and healthy eating tips.</p>

  <h2>Latest Articles</h2>
  <ul>
    <li>
      <a href="5-minute-clay-pot-recipes.html">
        5-Minute Clay Pot Recipes for Busy Weeknights
      </a>
    </li>
    <li>
      <a href="best-street-food-ahmedabad.html">
        Best Street Food in Ahmedabad: A Local’s Guide
```

```
    </a>
  </li>
  <li>
    <a href="healthy-snacks-under-100-rupees.html">
      Healthy Snacks Under ₹100 You Can Buy Online
    </a>
  </li>
 </ul>
</body>
</html>
```

Why this is good for SEO:

- Each link uses **descriptive anchor text** that tells users and search engines what the page is about.
- Avoids generic phrases like “click here” or “read more”, which provide no keyword context.
- Helps search engines understand the **topic relevance** of each linked article.

Task 2: Silo Structure Diagram for a Food Delivery App (Like Zomato)

Near Me

Internal linking strategy

The homepage should link to the major categories. Category pages should link to their relevant subpages, and related pages should link to each other where useful.

For example:

Home → Restaurants → Indian Restaurants → Restaurant Details

and:

Home → Offers → First Order Offers → Restaurant Details

This creates a clear hierarchy and helps search engines discover and understand related content.

Task 3: Rewriting Anchor Text for Flipkart-Style Product Page

Original links and optimized anchor text:

1. **Original:** "See more"
   Optimized: View more smartphones under ₹15,000
2. **Original:** "Click here for reviews"
   Optimized: Read customer reviews for this smartphone
3. **Original:** "Go to similar products"
   Optimized: Explore similar budget smartphones
4. **Original:** "Read about returns"
   Optimized: Learn about the easy return policy for mobiles

   Why this helps SEO:

- Anchor text now includes **keywords** users search for ("smartphones under ₹15,000", "customer reviews", "budget smartphones", "return policy").
- Improves **internal linking relevance**, helping those target pages rank better.
- Gives users a clearer idea of what they'll see after clicking, improving **CTR and UX**.

Task 4: Internal Link Juice on a BookMyShow-Style Movie Site

Suppose the website has these six internal pages:

1. Home
2. Movies Listing
3. Movie Details
4. Theatres
5. Offers
6. Help & Support

The two pages I would prioritize

1. Movies Listing page

Example: /movies/

2. Movie Details page

Example:

/movies/movie-name/

Why?

The **Movies Listing** page is an important category/hub page. It can lead users to hundreds or thousands of individual movie pages.

The **Movie Details** pages have strong commercial intent because users visiting them may want to check showtimes, theatres, reviews, and ultimately book tickets.

How I would adjust internal linking

I would structure the links like this:

Movie A Movie B Movie C

| | |

Showtimes Showtimes Showtimes

| | |

Theatres Theatres Theatres

I would:

- Give the **Movies Listing** page prominent links from the homepage.
- Link relevant movie detail pages from the Movies Listing page.
- Link related movies from individual movie pages.
- Link theatre/showtime pages back to the relevant movie page.
- Use descriptive anchor text such as **"Latest Hindi Movies"**, **"Movie Showtimes"**, or **"Book tickets for [Movie Name]"**.
- Avoid creating excessive links that don't help users.

The goal isn't simply to send as much internal PageRank/link equity as possible to two URLs. Internal linking should also reflect **site hierarchy, search demand, and user intent**.

Task 5: Topic Cluster for a Music Streaming App (Like Spotify)

Chosen topic cluster: “Workout Music & Playlists”

Pillar Page

- **Pillar:**

“Ultimate Guide to Workout Music: Playlists, Tips, and Trends”

This is a long, comprehensive page covering everything about workout music.

Cluster Pages (at least 3)

1. **Cluster 1:**

“Best High-Energy Playlists for Gym Workouts”

2. **Cluster 2:**

“Calming Music for Yoga and Stretching Sessions”

3. **Cluster 3:**

“How to Create Your Own Custom Workout Playlist”

Linking Strategy (Pillar-Cluster Model)

- The **pillar page** links out to each cluster page with descriptive anchors, e.g.:
    - “Explore our best high-energy playlists for gym workouts.”
    - “Discover calming music for yoga and stretching.”
    - “Learn how to create your own custom workout playlist.”

- Each **cluster page** links back to the pillar page using consistent anchor text, e.g.:
    - "This article is part of our ultimate guide to workout music."
- Cluster pages can also **interlink with each other** where relevant (e.g., the "Create Your Own Playlist" page can link to both "Gym Playlists" and "Yoga Music").

SEO benefit:

- This structure signals to Google that the site has **deep, organized coverage** of "workout music".
- The pillar page can rank for broad terms ("workout music"), while cluster pages rank for specific long-tail queries ("best gym playlists", "yoga music for relaxation").
- Internal links pass **link juice** within the cluster, strengthening the whole topic group.

Task 1:

Short-tail and Long-tail Keywords:

Short-tail Keywords:

1. Zomato
2. Food delivery
3. Restaurants
4. Online food order
5. Food near me

Long-tail Keywords:

1. Best food delivery app in India
2. Order pizza online near me
3. Best restaurants for biryani near me
4. Online food delivery with discounts
5. Restaurants offering late-night food delivery

Task 2:

These keywords are closely related to the main keyword **"mobile phones".**

1. Smartphone Deals
2. Latest Android Phones
3. 5G Smartphones
4. Best Camera Phones
5. Budget Smartphones Under ₹15,000

Task 3:

Classification of each search query:

Search Query	Search Intent	Reason
Best budget laptops 2024	Commercial	The user is comparing products and researching before making a purchase.
Buy iPhone 14 online	Transactional	The user intends to purchase the product online.
Spotify login	Navigational	The user wants to reach a specific website or login page.
How to use Paytm UPI	Informational	The user is looking for instructions or information.
Myntra vs Ajio	Commercial	The user is comparing two brands before deciding which

		one to use or buy from.

Task 4:

Food Delivery Search Queries with Intent Modifiers

1. **"Best biryani near me"**

   User Intent: The user wants to find the highest-rated Biryani restaurants nearby.

2. **"Zomato vs Swiggy delivery charges"**

   User Intent: The user wants to compare delivery fees before placing an order.

3. **"Healthy dinner options under 300 rupees near me"**

   User Intent: The user wants to nearby, healthy, and budget-friendly options that satisfy all three constraints at once.

Task 1:

1. Google Keyword Planner – Keywords for "Online Food Delivery" (Ahmedabad)

Key Words	Avg Monthly Search	Competition
Online Food Delivery Ahmedabad	1K-10K	High
Food Delivery Ahmedabad	1K-10K	High
Order Food Online Ahmedabad	1K-10K	High
Best Food Delivery App Ahmedabad	100-1K	Medium
Home Food Delivery Ahmedabad	100-1K	Medium
Restaurant Food Delivery Ahmedabad	100-1K	Medium
Fast Food Delivery Ahmedabad	100-1K	High
Pizza Delivery Ahmedabad	1K-10K	High
Late Night Food Delivery Ahmedabad	100-1K	Medium
Online Restaurant Delivery Ahmedabad	100-1K	Medium

2. Ubersuggest Analysis – "Buy Sneakers Online"

Keyword: Buy sneaker online

- Search Volume: ~8100/Month
- SEO Difficulty: 33(Medium)

  Lower Competition Keyword Suggestions:

Keywords	Search Volume	SEO Difficulty
Buy Running Sneaker Online	1300	22
Affordable Sneaker Online	720	18
Men's Sneaker Online Sale	590	20

Ubersuggest recommends focusing on long-tail keywords with lower SEO Difficulty (around 40 or below) for better ranking opportunities, especially for newer websites.

3. Answer The Public – "Digital Payments"

Five questions-based keywords ideas:

1. What do you mean by digital payment?
2. What are types of digital payment?
3. Is UPI a digital payment?
4. How does a digital payment work?

5. Are digital payments safe?

4. Google Autocomplete

Search typed

‘best headphones for…

1. Best headphones for gaming
2. Best headphones for music
3. Best headphones for running
4. Best headphones for gym
5. Best headphones for calls
6. Best headphones for studying
7. Best headphones for travel
8. Best headphones for laptop

How these help Flipkart

These autocomplete suggestions reveal real user search intent. Flipkart can use them to create:

- Dedicated product category pages
- SEO blog articles
- Buying guides
- Product comparison pages
- Optimized product titles and descriptions

This improves organic visibility and attracts shoppers searching for specific headphone use cases.

5. AlsoAsked (or Answer Socrates) – "IPL Tickets"

Long-tail keyword ideas:

1. IPL tickets online booking
2. How to buy IPL tickets online
3. IPL tickets price 2026
4. IPL match tickets near me
5. Best website to book IPL tickets

Easiest keyword to target

"How to buy IPL tickets online"

Reason:

- Long-tail keyword with clear informational intent.
- Lower competition than broad terms like "IPL tickets."
- Ideal for a new cricket fan blog because it answers a common beginner question and can naturally include booking steps, ticket prices, and official booking websites.

Task 8

1. 15 SEO keyword ideas for a new food delivery app targeting college students in Ahmedabad:

Prompt used: "Suggest SEO keywords for a food delivery app for college students in Ahmedabad."

No	Keywords
1	Food delivery for college students in Ahmedabad
2	Cheap food delivery Ahmedabad
3	Affordable food near college Ahmedabad
4	Student food delivery Ahmedabad
5	Late night food delivery Ahmedabad
6	Budget food delivery Ahmedabad
7	Food delivery near Ahmedabad colleges
8	Best food delivery app Ahmedabad
9	Cheap meals for students Ahmedabad
10	Food under 100 rupees Ahmedabad
11	Student meal deals Ahmedabad
12	Hostel food delivery Ahmedabad
13	Fast food delivery near colleges Ahmedabad
14	Affordable lunch delivery Ahmedabad

15	Midnight food delivery for students ahmedabad

2. Two ChatGPT Prompts for Long-Tail Keywords (Cricket Live streaming Website)

Prompt 1 (General)

"Suggest long-tail SEO keywords for a cricket live streaming website."

Sample Results

- cricket live streaming
- watch cricket online
- live cricket matches today
- cricket streaming website
- online cricket live

Prompt 2 (Specific)

"Suggest 15 long-tail SEO keywords for an Indian cricket live streaming website that streams IPL, international matches, and highlights. Target mobile users looking for free and HD streaming."

Sample Results

1. free cricket live streaming on mobile in India
2. watch IPL live streaming free on mobile
3. IPL live streaming HD on mobile
4. free HD cricket streaming online India
5. watch India cricket match live free on mobile
6. international cricket live streaming free in India
7. free live cricket streaming HD for mobile

8. watch IPL matches online free in HD
9. cricket live streaming website for mobile users
10. free cricket match live streaming HD online
11. watch cricket highlights free online in India
12. IPL match highlights HD online free
13. India cricket match highlights watch online
14. international cricket match highlights free online
15. watch cricket highlights on mobile in HD

Comparison:

Prompt	Result
General prompt	Gave broad and less targeted keywords.
Specific prompt	Produced more relevant long-tail keywords focused on IPL, HD streaming, mobile users, and Indian audiences.

3. Topic Clusters for a Music Streaming App

Cluster 1 – Free Music

- free music app
- listen to music online
- free MP3 songs

Cluster 2 – Playlist Creation

- create music playlist
- share playlists

- personalized playlists

Cluster 3 – Bollywood Songs

- Bollywood songs
- latest Hindi songs
- Bollywood music streaming

4. Keyword Difficulty Analysis (Example)

Keyword	Difficulty Score	Difficulty Level
restaurants near me	68	Hard
food delivery	74	Hard
online food order	60	Medium
pizza delivery Ahmedabad	33	Easy
budget meals Ahmedabad	22	Easy

Easiest Keyword to Rank For

budget meals Ahmedabad (Difficulty Score: **22**) because it is location-specific and has lower competition than broader food-related keywords.

5. Topic Cluster for a New IPL Fan App

Main Topic

IPL Fan App

Cluster	Keywords
Live Scores	IPL live scores, ball by ball updates, live match tracker
Match Schedule	IPL match schedule, upcoming IPL fixtures, today's IPL match
Player Statistics	IPL player stats, orange cap leader board, purple cap standings
Fantasy Cricket	IPL fantasy team, fantasy cricket tips, dream team prediction

Task 1: Guest Post Pitch

Niche: Sustainable Living and Eco-Friendly Kitchens

Target Website: The Better India

Email Draft

Subject: Guest Post Pitch: 5 Traditional Indian Clayware Habits That Cut Kitchen Energy Use

Hi The Better India Team,

I love your continuous coverage of grassroots sustainability in Indian households. I have drafted an actionable, research-backed piece titled "5 Traditional Indian Clayware Habits That Naturally Reduce Kitchen Energy Consumption." It provides practical tips on how earthenware cooking and natural cooling reduce electricity reliance while preserving nutrients.

Would you be open to reviewing the complete draft for an exclusive publication on The Better India?

Best regards,
Shabinabanu Kadiwala

Task 2: Backlinks for E-Commerce and Food Delivery Sites

Zomato (zomato.com)

Referring Domain 1: The Economic Times

Target Page Type: Press release and corporate news coverage.

Referring Domain 2: LBB (Little Black Book) (lbb.in)

Target Page Type: Curated restaurant directory / "Best food in town" recommendation list.

Swiggy (swiggy.com)

Referring Domain 1: NDTV Food (food.ndtv.com)

Target Page Type: Recipe and food culture blog post with an embedded ordering link.

Referring Domain 2: Moneycontrol (moneycontrol.com)

Target Page Type: Industry analysis / business model article.

Flipkart (flipkart.com)

Referring Domain 1: TechRadar India (techradar.com)

Target Page Type: Seasonal sale guide and product discount listicle.

Referring Domain 2: 91mobiles (91mobiles.com)

Target Page Type: Direct e-commerce product comparison page.

Task 3: Broken Link Replacement Message

Email Draft

Subject: Broken resource on your plastic-free living guide

Hi Tech team,

I was browsing your helpful guide on plastic-free living and noticed that the external link in your cookware section pointing to the old Safe Cookware PDF returns a 404 error.

We recently published a comprehensive guide titled "The Complete Guide to Lead-Free, Natural Clay Cookware & Testing Methods," which covers the same topic with updated safety standards.

If you'd like to update the dead link for your readers, the guide can be found at [Your Website URL]. Thanks for continuing to share great green-living resources.

Warmly,
Shabinabanu Kadiwala

Task 4: Skyscraper Technique on an Existing Article

- **Original Article:** "10 Tips to Start an Eco-Friendly Kitchen" (A basic 600-word listicle on a generic lifestyle blog).

Two Ways to Make It More Comprehensive

- **Add In-Depth Material Science and Practical Care Guides:** Expand the article into a 2,500-word guide detailing toxicity testing, step-by-step seasoning instructions for natural clay and cast iron, and energy-saving calculations.
- **Embed Interactive Visuals and Downloadable Checklists:** Include an infographic on the lifecycle impact of kitchenware materials (clay vs. Teflon vs. aluminum) and a printable single-page PDF starter checklist.

Backlink Outreach Strategy

- Export the backlink profile of the original thin article using Ahrefs or Semrush.
- Reach out to webmasters who linked to the original post, pointing out our newly created, updated guide with visual assets and asking if they would consider referencing it as a more comprehensive resource for their audience.

Task 5. Journalist Response (Digital PR Pitch)

Journalist Query: "Looking for founders/marketers sharing one creative, low-cost marketing tactic that helped a niche consumer brand gain traction."

Draft Pitch

"For niche, sustainable consumer goods, our highest-ROI organic tactic was partnering with local artisanal chefs for video recipe demos using traditional earthenware rather than running paid ads. By gifting authentic clay pots to micro-creators and letting them demonstrate natural cooking advantages to their loyal audiences, we earned authentic social proof and editorial backlinks from food review sites, driving a 40% organic sales boost with zero ad spend." — Shabinabanu Kadiwala, Brand & Marketing Strategist

Task 1. Basic llms.txt for a food delivery website (Zomato-like)

FoodExpress

> FoodExpress is a food delivery platform providing restaurant menus, restaurant information, ordering, and delivery services.

Restaurants

- [Restaurants](https://www.example.com/restaurants/): Browse restaurants available for food delivery.

- [Restaurant Menus](https://www.example.com/restaurants/menus/): View restaurant menus, dishes, prices, and availability.

- [Restaurant Pages](https://www.example.com/restaurants/): View restaurant details, cuisines, ratings, and delivery information.

Food Categories

- [Pizza](https://www.example.com/food/pizza/): Browse pizza restaurants and dishes.

- [Indian Food](https://www.example.com/food/indian/): Browse Indian restaurants and dishes.

- [Desserts](https://www.example.com/food/desserts/): Browse dessert restaurants and dishes.

Task 2. Full OpenAI/Google access, Anthropic blocked from /offers/

```
# llms.txt

# Full access for OpenAI bots
User-agent: GPTBot
Allow: /

User-agent: OAI-SearchBot
Allow: /

User-agent: ChatGPT-User
Allow: /

# Full access for Google AI
User-agent: Google-Extended
Allow: /

# Block Anthropic from the offers directory
User-agent: ClaudeBot
Disallow: /offers/

User-agent: anthropic-ai
Disallow: /offers/
```

User-agent: Claude-User

Disallow: /offers/

Task 3: llms-full.txt for a movie-ticket booking site

llms-full.txt for Movie Ticket Booking Site

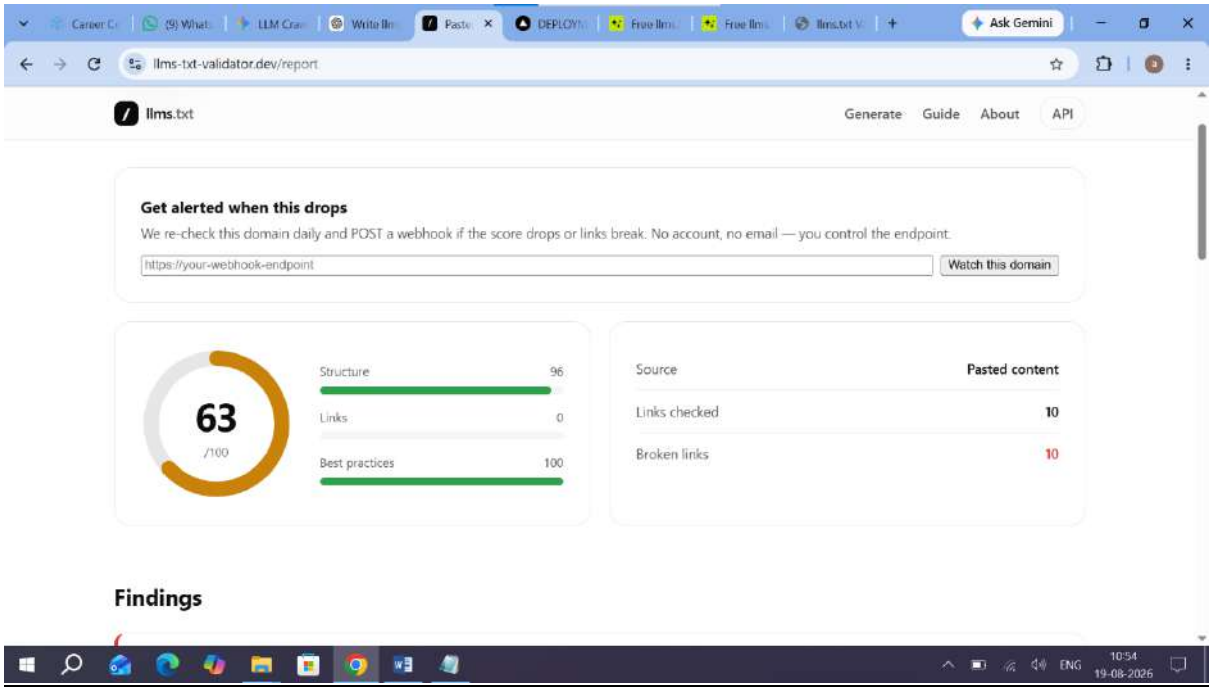

User-agent: *

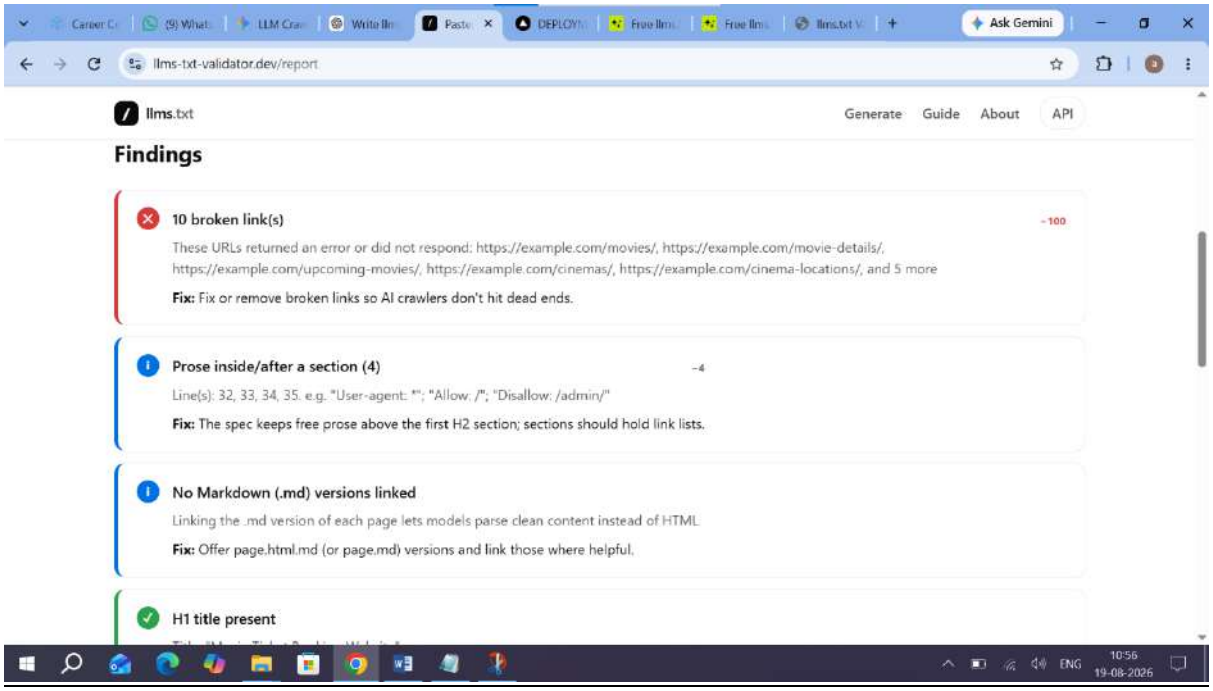

Allow: /

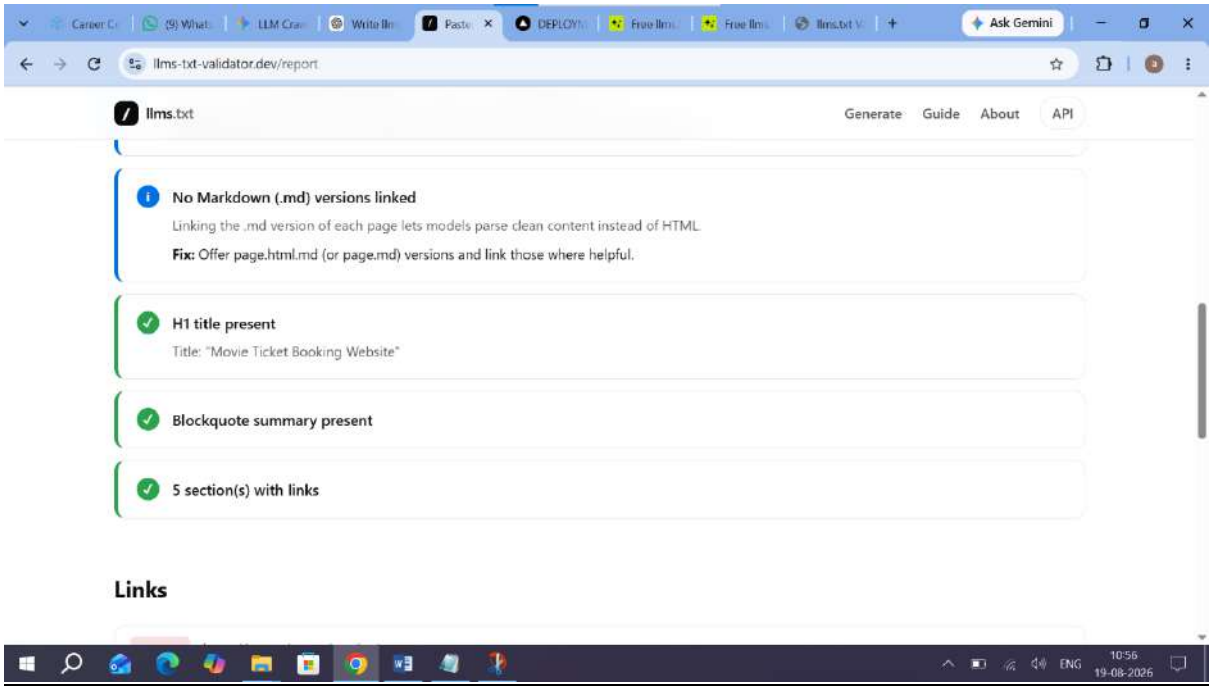

Disallow: /admin/

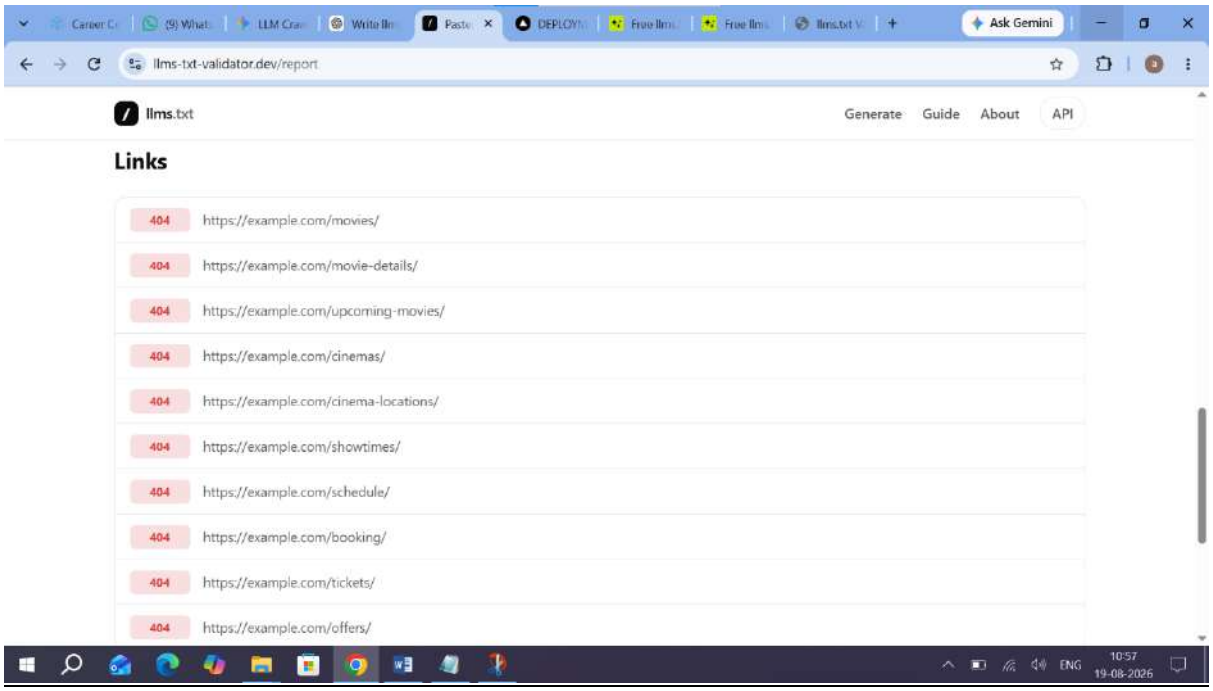

Disallow: /checkout/

Task 4:

llms-txt-validator.dev/report
llms.txt

Findings
10 broken link(s)
-100
These URLs returned an error or did not respond: https://example.com/movies/, https://example.com/movie-details/, https://example.com/upcoming-movies/, https://example.com/cinemas/, https://example.com/cinema-locations/, and 5 more
Fix: Fix or remove broken links so AI crawlers don't hit dead ends.
Prose inside/after a section (4)
-4
Line(s): 32, 33, 34, 35. e.g. "User-agent: *"; "Allow: /"; "Disallow: /admin/"
Fix: The spec keeps free prose above the first H2 section; sections should hold link lists.
No Markdown (.md) versions linked
Linking the .md version of each page lets models parse clean content instead of HTML
Fix: Offer page.html.md (or page.md) versions and link those where helpful.
H1 title present

Validation Result :

Overall Score: 63/100

Structure: 96/100

Best Practices: 100/100

Links Checked: 10

Broken Links: 10

Warnings / Errors Found:

1. 10 broken links were detected. The validator reported HTTP 404 errors for the example.com URLs used in the sample llms-full.txt file.
2. The validator reported prose inside/after a section. It identified the User-agent, Allow, and Disallow lines as prose that do not follow the expected llms.txt section/link-list structure.
3. No Markdown (.md) versions were linked. The validator recommended linking Markdown versions of pages where useful.

The file passed the main structural and best-practice checks, but the validator found 10 broken links because example.com was used as a placeholder domain. The report also flagged the crawler directives and the absence of Markdown versions. These findings were recorded as required by the task.

Task 5:

Best Practices for llms.txt and llms-full.txt

For a shopping app like Flipkart, the following three best practices should be followed when creating llms.txt or llms-full.txt files:

1. Keep the File Clear and Well Structured

Use a clear H1 title, short description, H2 sections, and relevant Markdown links. A well-structured file helps AI systems understand and access important website information easily.

2. Include Only Important and Useful Pages

Include important pages such as product pages, product categories, shipping information, return policies, and payment information. Avoid unnecessary or duplicate URLs so that AI systems can focus on useful content.

3. Protect Private and Sensitive Sections

Do not expose private sections such as admin pages, customer accounts, and checkout pages through AI-readable content. For actual crawler access restrictions, use robots.txt and proper authentication/access controls.

LOCAL CITATIONS

TASK : 1

5 Local Businesses – NAP Data

https://docs.google.com/spreadsheets/d/1wVq4p_LD4cOzKqzvPXnlf9NBzXGEocFqDrcqWNLEDG0/edit?usp=sharing

---

TASK :2

NAP Comparison – Hotel Shiv Shakti

Citation Site	Name	Address	Phone	Inconsistency
Justdial	Hotel Shiv Shakti	NH27, Bhatiya Society, Wankaner – 363621, Gujarat	9726929394	—
Zomato	Hotel Shiv Shakti	NH 8, Near Shiv Shakti Hero Showroom, Wankaner Locality, Wankaner	9726929394	Address format/reference point differs
Restaurant Guru	Hotel Shiv Shakti	JX44+8MW, Wankaner, Gujarat	9726929394	Uses Plus Code instead of conventional street description

Justdial gives NH27, Bhatiya Society, while Zomato describes the location as NH 8, near Shiv Shakti Hero Showroom. The phone number matches across the sources.

Conclusion: The main NAP inconsistency is the address format/road reference, not the phone number.

Task 3:

Tool	Official page	What to do	Expected assignment evidence
BrightLocal Citation Tracker	https://www.brightlocal.com/local-seo-tools/citation-tracker/	Open the tool, start the free citation audit, enter the business details, review Name/Address/Phone issues and duplicates, then capture the results screen.	Screenshot of the audit/results page showing NAP consistency findings.
Alternative: Synup Listing Scan	https://www.synup.com/en/tools	Open Listing Scan Tool, enter the business details, review listing accuracy across directories, and capture the results.	Screenshot of the scan/results page.
Important note		A live third-party audit form cannot be submitted from this chat session, so the workbook leaves the screenshot step for you to perform in the browser.	

TASK:4

3 India-Focused Citation Sites for a Food Delivery Startup

1. Justdial – Important because it has extensive local-business coverage in Indian cities and is useful for local discovery and citations. Wankaner businesses are actively listed there.
2. Sulekha – Useful for establishing another Indian local-business citation and reaching users searching for local services/businesses. Sulekha maintains city-specific business directories.
3. India MART – Useful for business visibility and company discovery, particularly when the startup also targets restaurants, vendors, suppliers, or B2B partnerships.

TASK:5

Step	Practical process
1	Choose a citation-management platform. For this assignment, use Yext's free business scan/demo or Synup's Listing Scan.
2	Enter a fictional practice business if you do not control a real business. Example: 'Rajkot Fresh Bites', Rajkot, Gujarat.
3	Enter the canonical NAP: exact business name, full address, phone number and website.
4	Run the scan/listing check to see where the business is already listed and where data is missing or inconsistent.

5	Open the Listings section and review the publisher records. Synup describes this workflow as viewing listings, connecting platforms, updating profiles, and adding a new location through its location wizard.
6	Edit incorrect NAP fields so the same canonical version is used everywhere.
7	If the platform asks for verification, complete the available verification method. Yext documents Google verification methods such as email, SMS, phone or video depending on eligibility.
8	Save/submit the changes and monitor the listing status. Take a screenshot of the final confirmation/status page for the assignment.

Task 1:

Citation Site	Name	Address	Phone	Inconsistency
Official Website / Google Listings	The Grand Thakar (TGT – The Grand Thakar)	Jawahar Road, Opposite Jubilee Garden, Lohana Para, Rajkot, Gujarat – 360001	+91 96871 89099 (Google listing); +91 281 2230091 (official contact listing)	Phone number differs between listings; the official website also lists separate contact numbers for reception and takeaway.
Google Business Listing	Saraza	Kalavad Road, Opposite Cosmoplex Cinema, Rajkot, Gujarat – 360005	+91 72728 72727	Saraza has multiple outlets in Rajkot with different addresses and phone numbers, so the specific branch must be identified when matching citations.
Google Business Listing	Lords Banquet Restaurant	Ground Floor, Opposite Sargam Foods, Kasturba Road, Opposite Temptation, Kashivishwanath Plot, Sadar, Rajkot, Gujarat – 360001	+91 281 244 4486	The listing uses a landmark-based address description; other directories may shorten the address or use a different nearby landmark. The difference should be confirmed against another listing before treating it as a verified inconsistency.

Task 2: NAP (Name, Address, Phone) for 3 popular restaurants in Rajkot

1. **The Grand Thakar (TGT – The Grand Thakar)**
    - Google Maps / common listing:
      Name: The Grand Thakar
    - Address: Opposite Jubilee Garden, Jawahar Road, Kothi Compound / Sadar, Rajkot, Gujarat 360001
    - Phone: +91 87580 46757 / +91 96871 89099 / +91 95744 50010

   Zomato:
   Name: TGT - The Grand Thakar (Jubilee Chowk)
   Address: Opposite Jubilee Garden, Jawahar Road, Sadar, Kothi Compound, Rajkot
   Phone: +91 95744 50010

   Official website (hotelthakar.com): Similar address, phones vary slightly.

   Inconsistencies: Phone numbers differ across platforms (multiple numbers listed). Address has minor variations (“opp. Jubilee Garden” vs “Jawahar Rd, opp. Jubilee Road”).

2. Saraza

- Google / common:
  Name: Saraza
  Address: Opp. Cosmoplex Cinema, Kalawad Road, Rajkot, Gujarat 360005
  Phone: +91 72728 72727
- Zomato: Same name and address, phone matches.
- Official (saraza.in): Same address and phone.

Inconsistencies: Mostly consistent. Minor spelling differences (“Kalavad” vs “Kalawad”).

3. Lords Banquet Restaurant

- Google / common:
  Name: Lords Banquet Restaurant
  Address: Ground Floor, Opp. Sargam Foods / Opp. Temptation, Kasturba Road,

Kashivishwanath Plot, Sadar, Rajkot, Gujarat 360002
Phone: 0281-244 4486 / +91 281 244 4486

Zomato:
Name: Lord's Banquet Restaurant - Since 1982
Address: Kasturba Road, Near Mohan Bhai Hall, Kothi Compound, Rajkot
Phone: +91 281 244 4486

Task 3: 5 local citation websites + required information

Website	What information is typically required to submit
Justdial (justdial.com)	Business name, category, full address with pincode, phone number, email, business hours, photos, description
Sulekha (sulekha.com)	Business name, category/service type, address, phone, email, photos, description, service areas
IndiaMART (indiamart.com)	Company name, address, phone, email, products/services, GST (if applicable), photos, description
Yellow Pages India (yellowpages.in or similar)	Business name, address, phone, category, website (optional), description
Grotal (grotal.com)	Business name, address, phone, category, email, photos, hours, description

Task 4: Local Rank Tracking Audit

- Target Keyword: pizza near me
- Target Business: Domino's Pizza (A.V. Nagar / Yagnik Road Branch)
- Location set in Tool: Rajkot, Gujarat, India
- Tracking Tool Used: Whitespark Local Search Results Checker / BrightLocal Local Search Results Checker (Demo)

- Date Checked: August 16, 2026

Audit Findings:

- Local Map Pack Position: #1 (Position 1 in Google Local 3-Pack)
- Organic Search Position: #1 (Top organic snippet under map listings)
- Notes: Due to high citation velocity, exact GEO-targeted coordinates along Yagnik Road, and thousands of user reviews, this location holds the top local pack spot for "near me" pizza queries within central Rajkot.

Task 5: Citation Building Tool – BrightLocal

Objective

To understand how a citation-building tool is used to create or update business listings across online directories and improve the consistency of NAP (Name, Address, Phone Number) information.

Tool Used

BrightLocal – Citation Builder

Website: https://www.brightlocal.com/citation-builder/

Step-by-Step Process

Step 1: Open the Tool

I visited the BrightLocal website and reviewed its Citation Builder service. The tool helps businesses create new directory listings, update existing listings, and identify duplicate listings.

Step 2: Create a Practice Business Profile

For practice, I used the following fictional business details:

- Business Name: Sunrise Family Restaurant
- Category: Restaurant

- Address: 25 Market Road, Ahmedabad, Gujarat, India – 380001
- Phone: +91 90000 12345
- Website: https://example.com
- Business Hours: 10:00 AM – 10:00 PM
- Description: A family restaurant serving Indian meals, snacks, and beverages.

Note: All business details above are fictional and intended for practice only.

Step 3: Enter Business Information

I prepared the business name, address, phone number, website, category, business description, and operating hours. I checked that the business name, address, and phone number were written consistently.

Step 4: Check Existing Listings

Before creating a new citation, I would check whether the business already appears on directories such as Google Business Profile, Bing Places, and relevant local business directories. This helps avoid duplicate listings.

Step 5: Select Citation Sites

Within a BrightLocal Citation Builder campaign, I would select relevant directories and citation websites for the business. The choice of directories would depend on the business category and location.

Step 6: Submit or Update the Listing

I would start a new citation campaign using the prepared business information. If a listing already existed, I would request an update to its details. If no listing existed, I would request the creation of a new listing. Some directories may require account access or additional verification.

Step 7: Review Submission Status

After submission, I would check the campaign report to review the progress of each listing. I would distinguish between listings that had been submitted, those awaiting verification, and those confirmed as live.

Step 8: Verify Listing Accuracy

Finally, I would review the published listings to ensure that the business name, address, phone number, website, and other details were accurate and consistent across directories. Any incorrect information or duplicate listing would be flagged for correction.

Result

This exercise demonstrates how a citation-building tool can help organize business information, create or update online directory listings, and maintain NAP consistency. Accurate citations can support local SEO by helping search engines and potential customers find reliable business information.

Conclusion

BrightLocal Citation Builder provides a structured process for managing local business citations. The most important steps are preparing accurate business details, checking for existing listings, selecting relevant directories, monitoring submissions, and verifying published information. In this exercise, I reviewed the workflow using fictional business details; I did not submit a real business listing.

TASK :1

Mobile vs Desktop Comparison

Website selected: Myntra

I compared the Myntra website on desktop and mobile browsers.

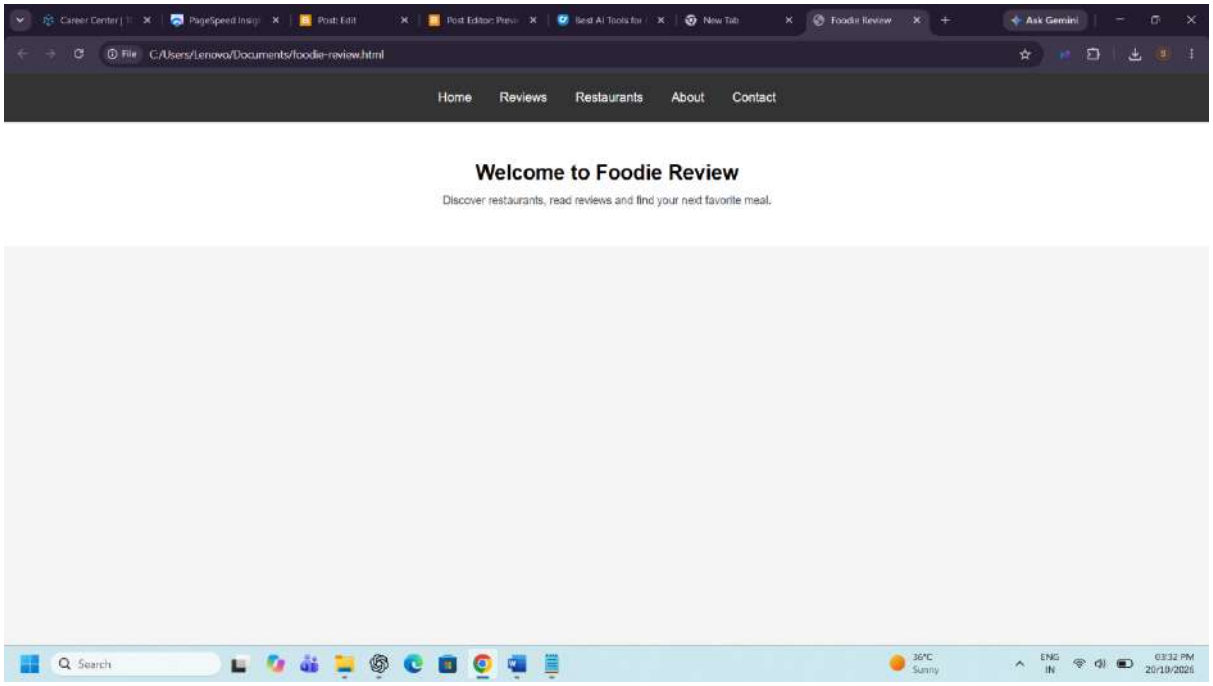

Three differences noticed:

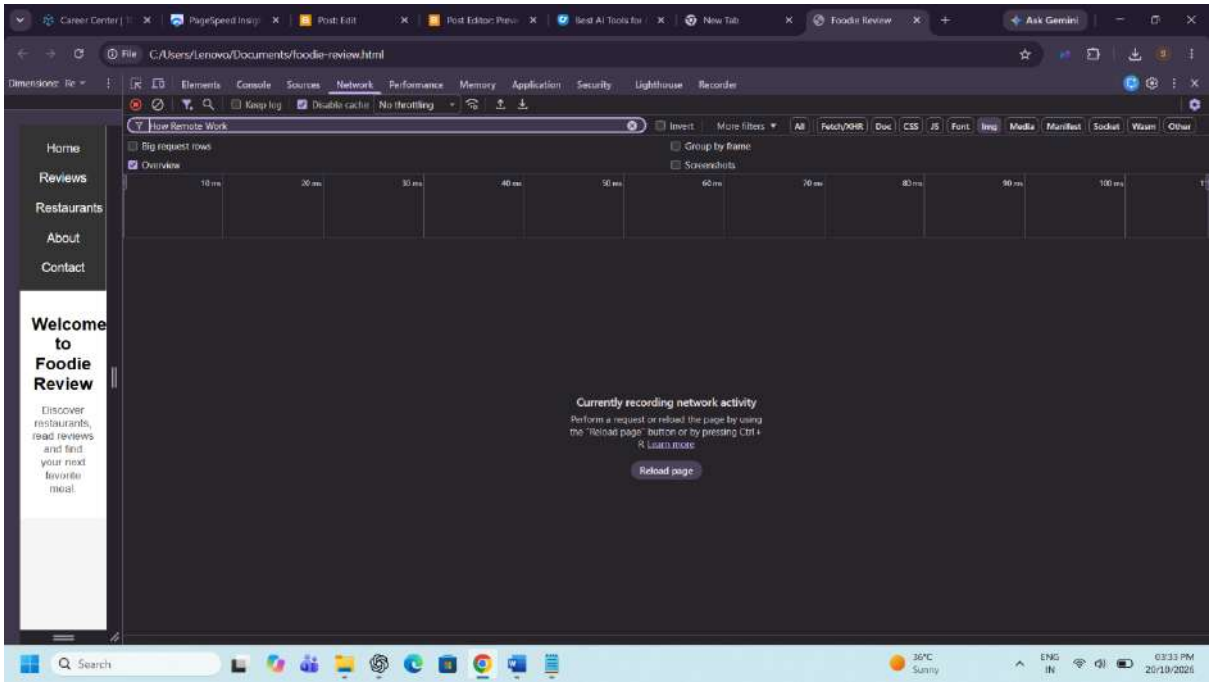

Feature	Desktop	Mobile
Navigation	Full navigation bar with categories such as Men, Women, Kids, Home and Beauty	Navigation is simplified and uses compact menus/icons
Layout	Products are displayed in a wider multi-column grid	Products are displayed in a narrower, mobile-friendly grid
Features	More options and controls are visible simultaneously	Search, wishlist, profile and cart are prioritized for easy thumb access

Relation to Mobile-First Indexing

These differences show responsive design because the website adapts its layout according to the screen size. Google uses the **mobile version of a website's content for indexing and ranking**, so important content, headings, metadata, images and structured data should remain available on mobile.

Task 2:

Result

On desktop, the navigation links appear **horizontally**.

On screens smaller than **600px**, the @media query changes the navigation into a **vertical mobile-friendly menu.**

TASK : 3

Mobile-Friendly Test

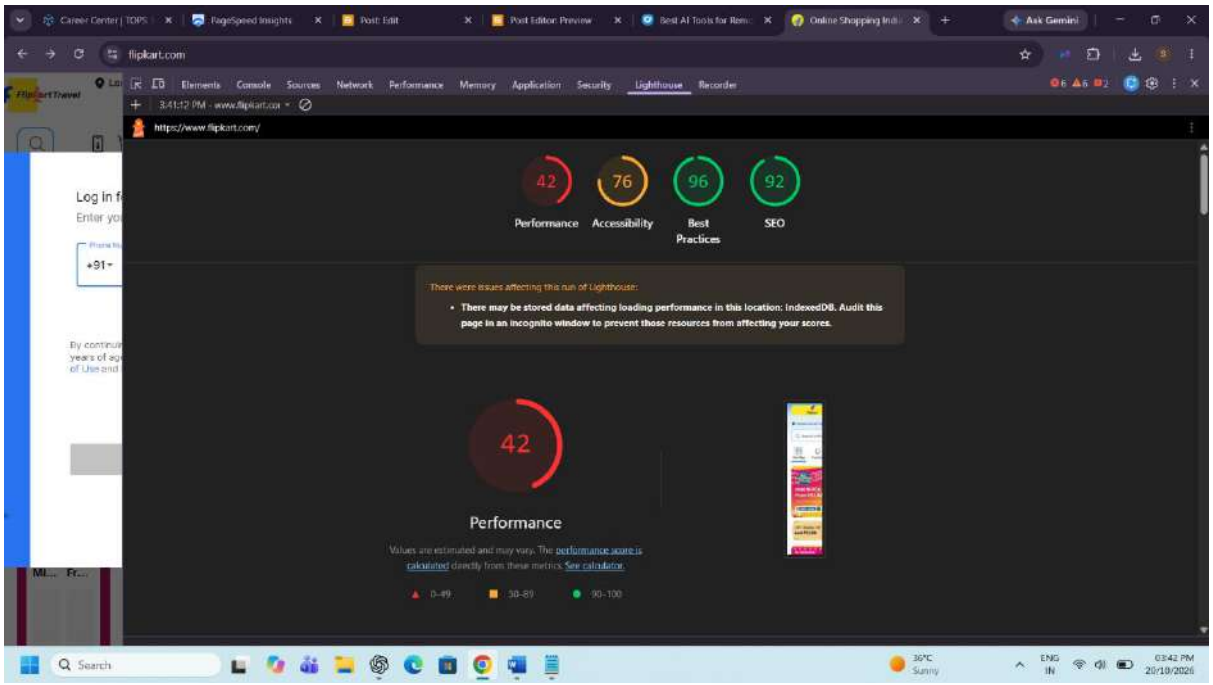

Website: Flipkart
Page Tested: https://www.flipkart.com/
Tool Used: Google Mobile-Friendly Test / Lighthouse mobile audit

Result: The mobile audit identified the following 2 usability issues:

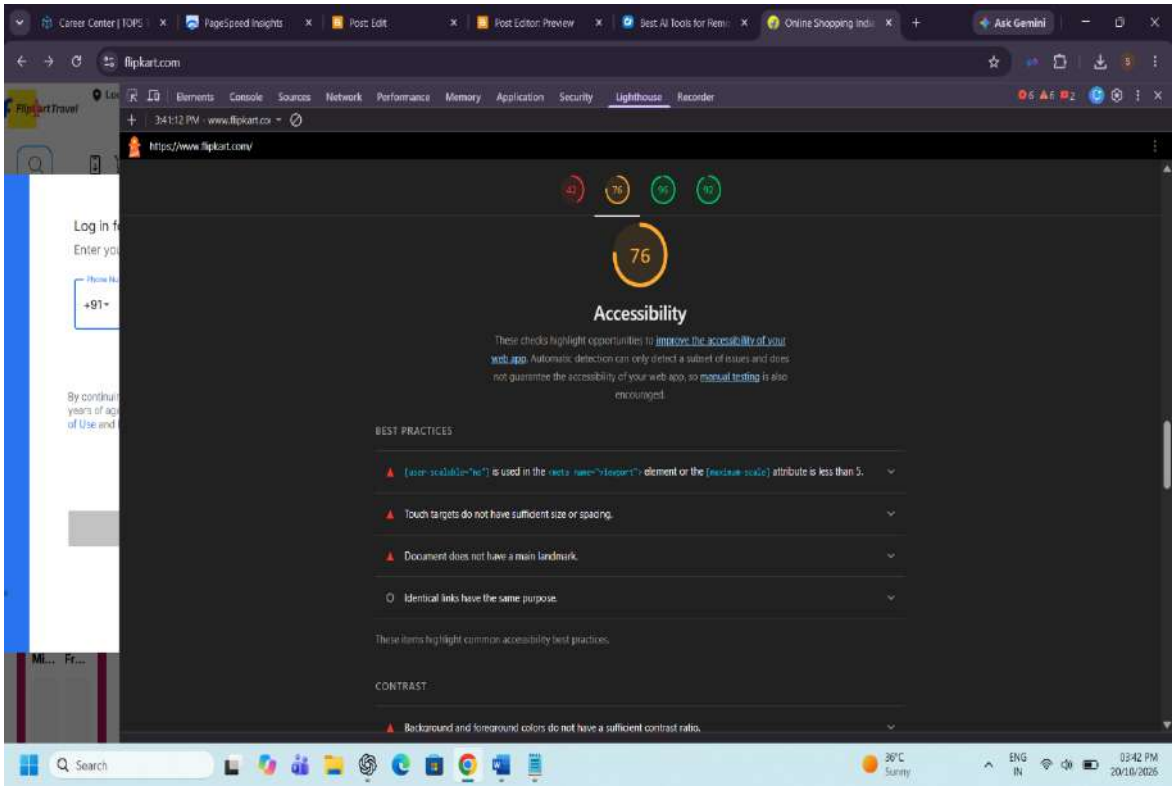

Touch targets do not have sufficient size or spacing.

Links do not have a discernible name.

shows the touch-target issue.

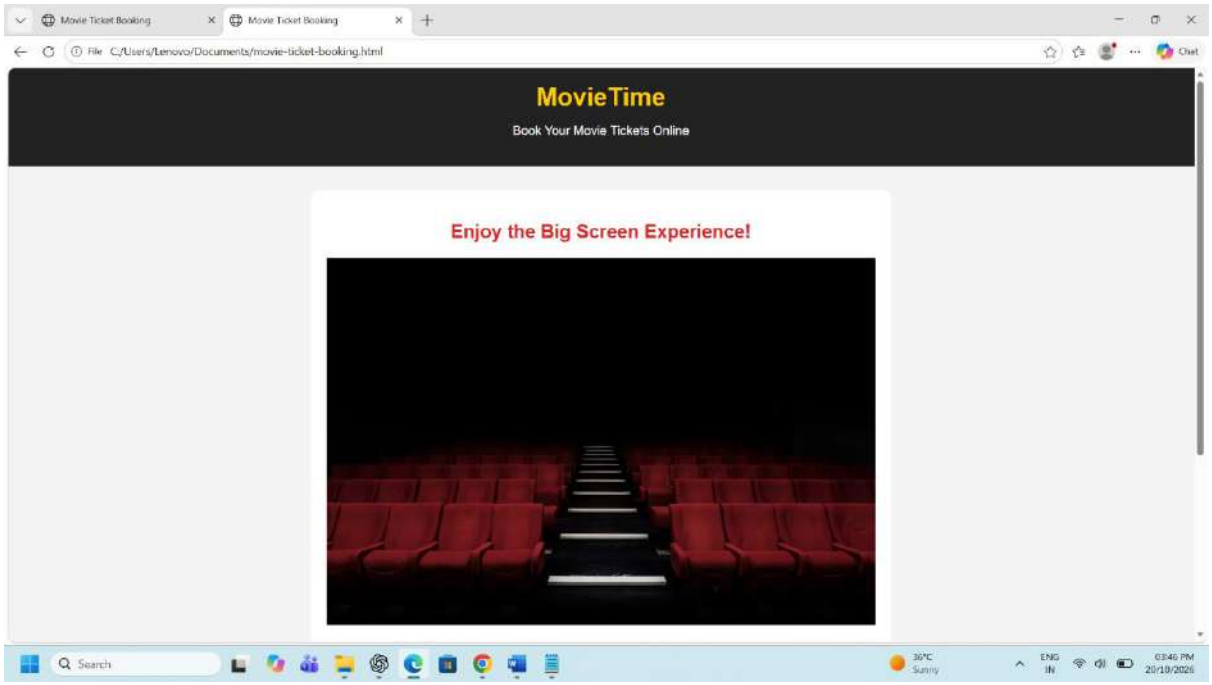

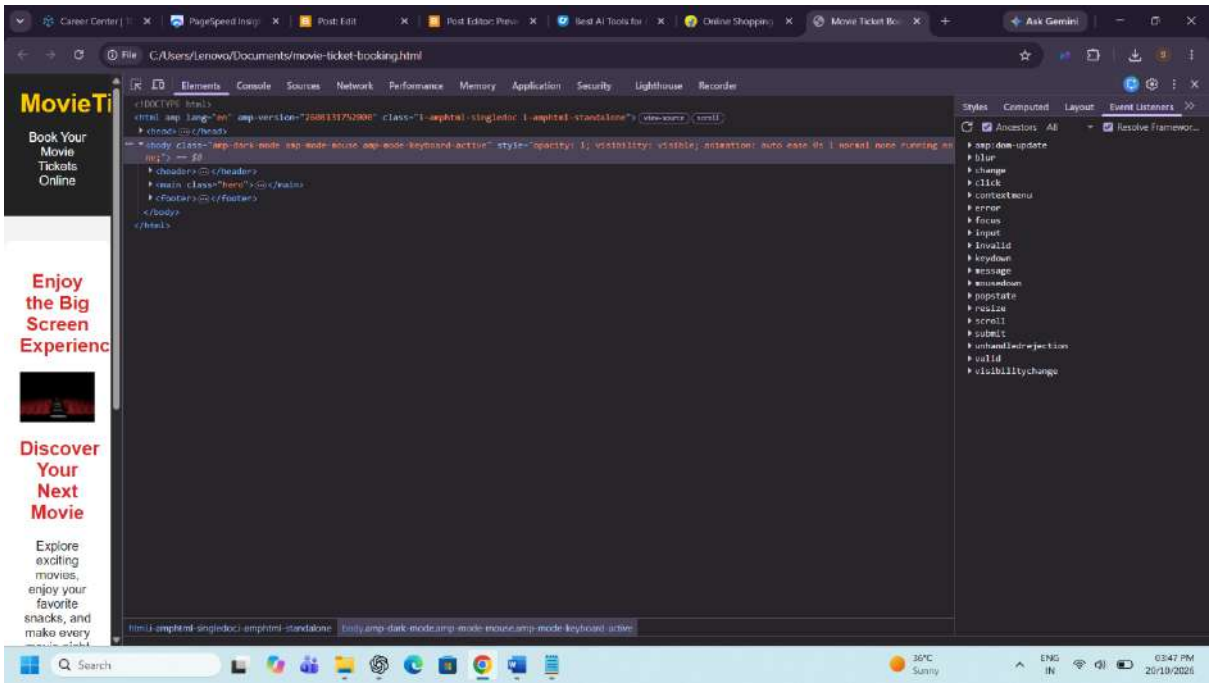

shows the links/label issue

Task:4

AMP Movie Ticket Booking Page

```
<!doctype html>
<html amp lang="en">
<head>
    <meta charset="utf-8">
```

```
<title>Movie Ticket Booking</title>
<link rel="canonical" href="https://example.com/movie-ticket-booking.html">

TASK:5

Mobile SEO Checklist Review

For this task, Google Search Central is a better source than a random SEO blog because Google directly documents mobile-first indexing and mobile SEO requirements. Google recommends responsive design and emphasizes that the mobile version should contain the important content, metadata, structured data and crawlable resources.

Website reviewed

My Blogger website:
https://shabinaablog.blogspot.com/

Mobile SEO checklist review

Checklist Item	Current Status	Improvement
Responsive design	Needs checking	Use a responsive Blogger theme
Page speed	Can be improved	Compress large images and use WebP
Mobile navigation	Can be improved	Keep menu simple and easy to tap
Image optimization	Can be improved	Use descriptive filenames and ALT text
Content visibility	Should be maintained	Ensure important desktop content is also available on mobile

Three specific improvements

1. Improve page loading speed

Large images can slow down mobile pages. I would compress images and use modern formats such as WebP where appropriate.

2. Improve mobile navigation

The navigation should be simple, readable and easy to tap on a small screen. Unnecessary menu items should be reduced.

3. Ensure the same important content is available on mobile

Important headings, text, images, metadata and structured data should not be removed from the mobile version. Google specifically recommends keeping equivalent primary content on mobile because Google uses the mobile version for indexing and ranking.

Conclusion

The review shows that mobile SEO is not only about making a website visually responsive. The mobile version must also provide Google's crawlers with the important content and metadata required for indexing. Google recommends responsive web design because it is generally the easiest configuration to maintain.

Modern Search Landscape

1. You Tube Search Analysis

Search query: How to make Dalgona Coffee

Video Title	Common Keywords
How to make Dalgona Coffee	Dalgona Coffee, Recipe, Make
Easy recipe of Dalgona Coffee	Easy, Dalgona Coffee, Recipe
Cafe style Dalgona Coffee	Dalgona Coffee, Café style
Perfect Whipped Dalgona Coffee	Whipped, Dalgona Coffee
Homemade Dalgona Coffee	Homemade, Dalgona Coffee

Most Common Keywords:
Coffee,
Dalgona Coffee,
Recipe,
Whipped,
Make,
Homemade.

2. Amazon Keywords Analysis

Product titles:

1. boAt 2026 Launch Airdopes Joy v2, 35H Battery, Pocketable Design, ASAP™ Charge, 13mm Drivers, Easy Touch Controls, ENx™ Tech, IWP™ & App Support TWS Bluetooth Earbuds with mic (Dusty Rose)
2. boAt Airdopes 219, 4Mics ENx, 40H Battery, Best in Segment for Calling, Stream Ad Free Music via App Support, Bluetooth Earbuds, TWS Ear Buds Wireless Earphones with mic (Ivory Mist)
3. OnePlus Nord Buds 3r TWS Earbuds up to 54 Hours Playback, 2-mic Clear Calls, 3D Spatial Audio, AI Translation, 12.4mm Drivers, Dual-Device Connectivity, 47ms Low Latency - Ash Black

Repeated Keywords:

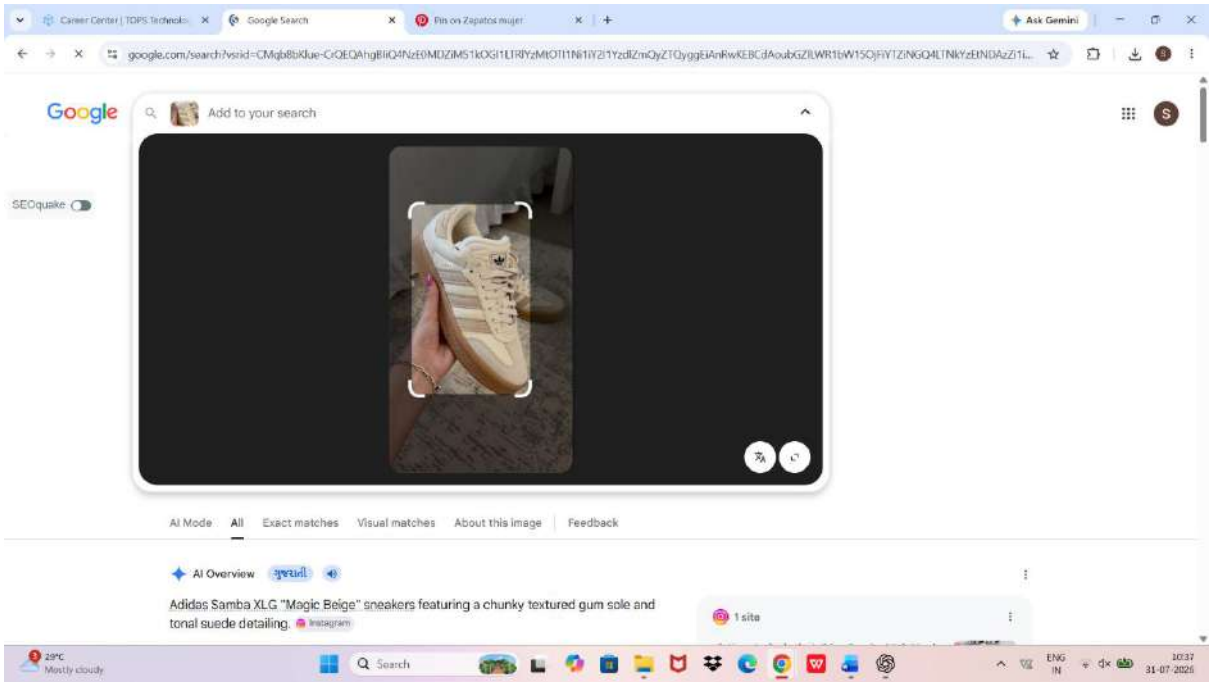

- Earbuds
- Wireless
- Bluetooth
- Noise cancellation
- In- Ear

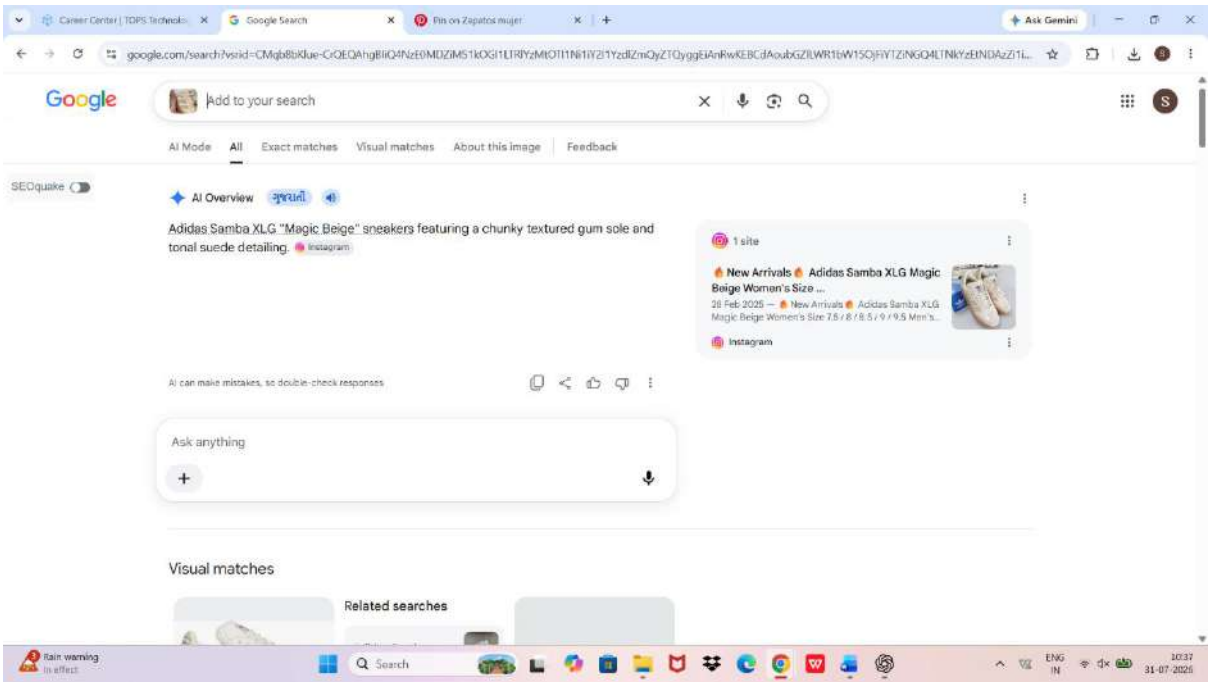

Alternative Keywords Sellers Could Use:

- True Wireless Earbuds
- Bluetooth Earphones

Observation:
Most listings repeat important search terms like **Wireless**, **Bluetooth**, **Earbuds**, and **TWS** because customers frequently search using those keywords.

Task 3:

I used Google Lens to search an image of a sneaker. Google Lens identified the shoe as an Adidas Samba XLG "Magic Beige" sneaker with a chunky textured gum sole and tonal suede detailing**.**

The search results included:

- The exact product name (Adidas Samba XLG "Magic Beige").

- A short AI Overview describing the shoe's design.
- A shopping/result card linking to an Instagram page selling the shoe.
- Visual matches showing similar Adidas sneakers.
- Related searches for similar shoe models and styles.

How Google Lens Interpreted the Image:

Google Lens analysed the shoe's visual features, including its **Adidas logo, colour (beige/cream), gum sole, shape, and suede material**. Using these characteristics, it matched the image with similar products available online and provided shopping-related information along with visually similar sneakers.

Task 4:

Voice Search vs Typed Search

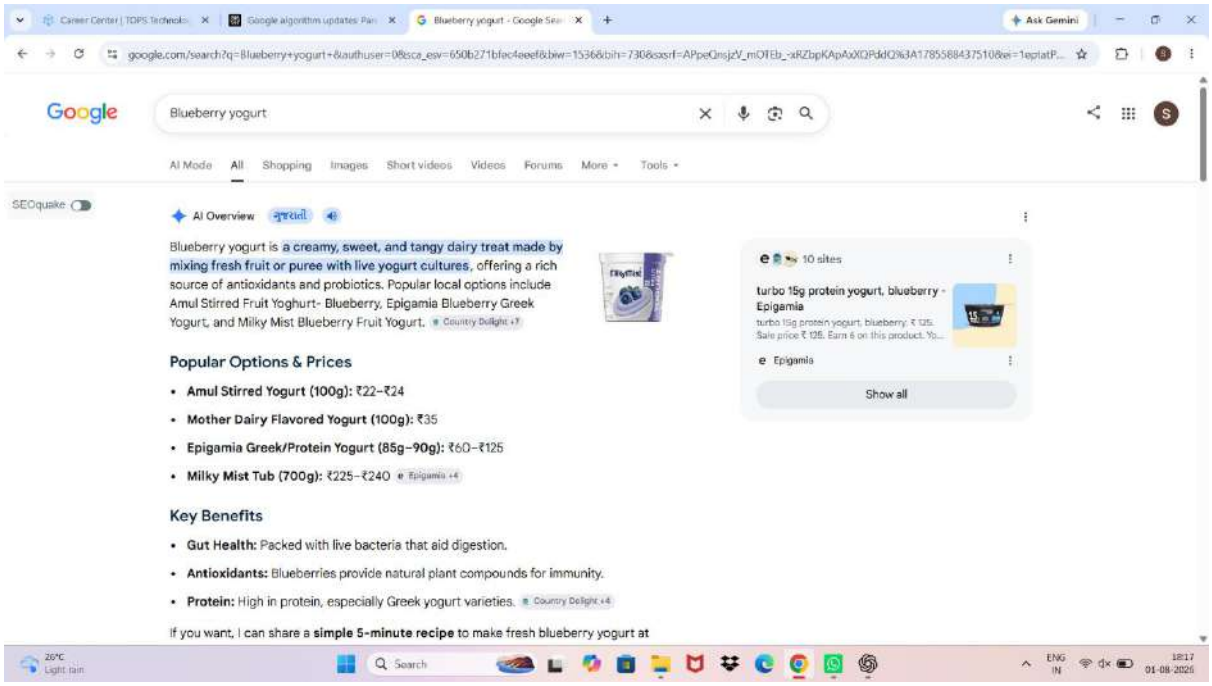

Comparison

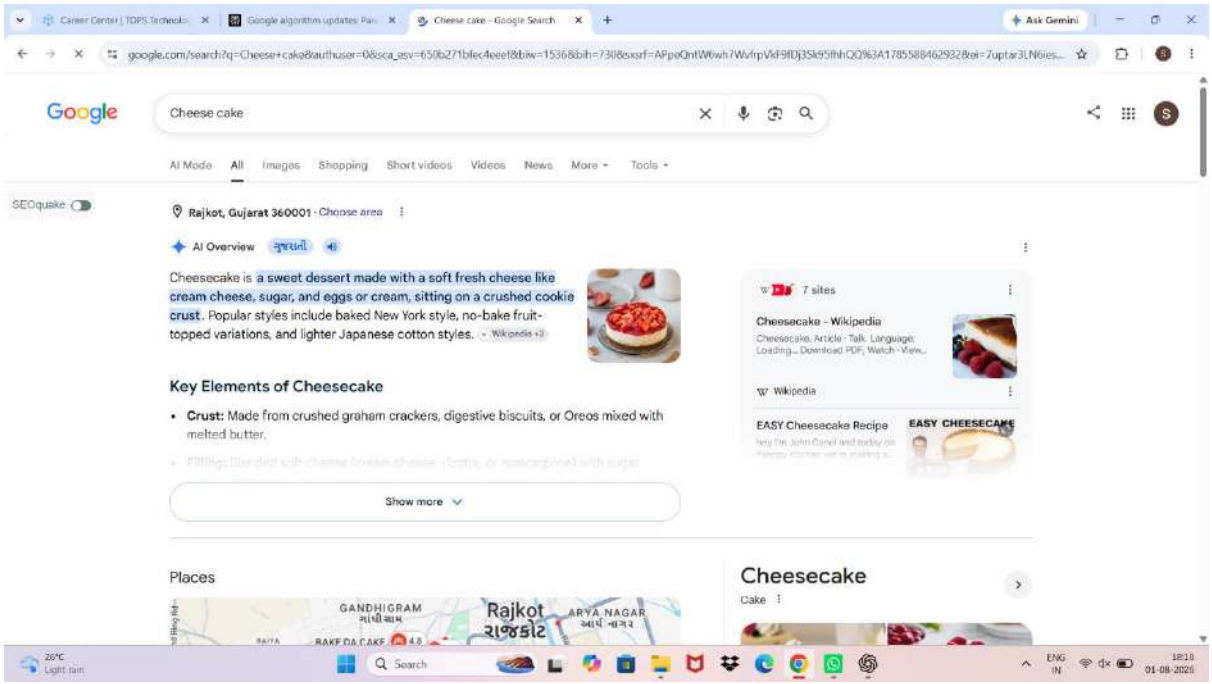

Voice Search	Typed Search
Shows nearby restaurants using GPS	Shows the same nearby restaurants
Opens Maps results immediately	Displays map pack with search results
Provide spoken answers	No spoken response

Task 5:

A zero-click search (often called zero search) is when a user finds the answer to their query directly on the search engine results page without clicking on any external website links.

Examples:

Task 1 — Compare DA and PA of two websites

Website	Homepage	Domain Authority (DA)	Page Authority (PA)
Zomato	zomato.com	**82**	**58**
Instagram	instagram.com	**94**	**100**

Domain Authority measures the ranking strength of the entire domain across all its pages based on root domain link profiles. In contrast, Page Authority predicts the ranking potential of that specific individual homepage URL based on direct internal and external link signals.

Task 2 — Three real backlinks pointing to Flipkart.com

No.	Linking Page	Target Flipkart URL	Link Type
1.	CrazyEngineers — "Suggest Books On Fundamentals Of VLSI"	flipkart.com/author/kumar	NoFollow
2.	CrazyEngineers — same discussion	flipkart.com/author/s-k-mehrotra	NoFollow

3.	CrazyEngineers — same discussion	flipkart.com/author/p-p-singh	NoFollow

Why is a DoFollow backlink more valuable?

A normal followed backlink can contribute to the linking site's authority signals, whereas a nofollow link tells Google not to associate the linking site with or crawl the linked page in the usual way. Ahrefs also states that nofollow links do not increase its Domain Rating.

Task 3 — Trust Flow, Citation Flow and Domain Rating

Authority Metrics Comparison for BookMyShow

Metric	Tool	Typical Score	Description
Trust Flow(TF)	Majestic	~52 / 100	Indicates the **quality** of backlinks by measuring how closely connected the site is to trusted, editorially vetted seed sites
Citation Flow (CF)	Majestic	~61 / 100	Reflects the raw **link** count and

			link equity passing to the site, regardless of site quality
Domain Rating (DR)	Ahrefs	~81 / 100	Measures the overall **strength** and size of the backlink profile relative to all other websites in the index

Task 4: Off-Page SEO for a Music Playlist App

Activity	**Target**
Guest articles and music-related content	Music blogs
Playlist/artist collaborations	YouTube music channels
Digital PR and original music research	Tech/music publications

Task 5: DoFollow Backlink Strategies for a Food Delivery App

AI-Generated Suggestions

1. **Create an original food-delivery industry report**
   Target: Food blogs, business websites, startup publications, and local

news sites. Collect original data about food-delivery trends, popular cuisines, delivery times, or customer preferences. Journalists and bloggers may link to the report when using your statistics in their own articles.

2. **Build free restaurant-related tools Target:**

   Restaurant blogs, hospitality websites, and business websites. Create useful tools such as a food-cost calculator, restaurant profit calculator, or menu-pricing calculator. Other websites can link to the tool as a useful resource for their readers.

3. **Create local restaurant spotlight pages target:**

   Restaurant websites, local food bloggers, city guides, and local newspapers. Feature independent restaurants and chefs on your website. The restaurants and local publications may link to their featured pages when sharing the coverage.

4. **Publish food-trend infographics target:**

   Food blogs, lifestyle websites, online magazines, and social-media publishers. Create original infographics showing trends such as the most popular cuisines in different Indian cities. Give publishers permission to reuse the infographic with attribution and a link to the original page.

5. **Collaborate with food bloggers on original research Target:** Food bloggers, YouTube food channels, restaurant reviewers, and food magazines. Conduct useful experiments, such as comparing delivery times, packaging quality, or customer preferences. Publish the complete results on your website so participating creators have a reason to reference and link to the study.

My Favorite: Creating an Original Food-Delivery Industry Report

I would choose **the original food-delivery industry report** because it gives a startup something genuinely useful to promote rather than simply asking websites for links. If the research contains interesting or unique statistics, food bloggers, journalists, and business publications can reference the data in their articles and link back to the startup's website.

It can also generate **multiple backlinks from different websites**, while simultaneously increasing brand awareness and credibility.
